CONTENTS

Subscription rates: UK £13.50 including postage. Airmail and other rates upon application to ZX Computing Subscriptions, Intonet Ltd, Times House, 179 The Marlowes, Hemel Hempstead, Herts HP1 1BB (Tel: 0442 48432)

ZX Computing is constantly on the look out for well written articles and programs. If you think that your efforts meet our standards please feel free to submit your work to us for consideration for publication.

All submitted material should be typed if possible, handwritten work will be considered but please use your neatest handwriting. Any programs submitted should be listed in essence of your program alone will not be considered. All programs must come complete with a full explanation of the operation and, where relevant, the structure. Spectrum programs should be accompanied with a cassette of the program as well as the listing.

All submissions will be acknowledged and the copyright in such works which will pass to Argus Specialist Publications Ltd will be paid for at competitive rates. All work for consideration should be sent to the Editor at our Golden Square address.

IPUTING

ZX Computing is published monthly on the fourth Friday of the month. Distributed by Argus Press Sales & Distribution Ltd, 12-18 Paul Street, London EC2A 4JS. 01 247 8233. Printed in the UK by Garnett Print, Rotherham and London.

Welcome

This issue marks the end of the second year of my occupation of the Editor's chair and ironically the last time my posterior will warm that illustrious plastic

Yes folks the time has come for me to move on

In the time I have spent producing ZXC there have been many changes the Spectrum established its dominance and the QL emerged – although only lately has it begun to sell in large quantities and now the 128K Spectrum

Through all this we have maintained our policy of providing something for everyone and in return our readers have been some of the most loyal around But times change and in computer circles faster than any other and we must keep up with them So ZXC has undergone much discussion and there are many new and exciting developments in store

For a start and many of you have indicated that you would be in favour of such a move we will become a monthly publication Twice the amount of info games programs reviews and articles a year as in the past

As for myself I am pleased to hand over to Bryan Ralph who has done excellent work on other Argus publications and whom I know will bring a new freshness and drive to ZXC But before you get out the hankies (or cheer wildly as the case may be) I will still be around and writing for the mag – look for those tell tale tongue in cheek remarks cynical comments and verbal flatulence

Onwards and upwards!

A leaving present

It's not often we use a program in this section but I was talking to a TV producer the other day and I mentioned my involvement with computers

Oh yes he said All our programs are computerised now

What meanest thou? asked yours truly

Just what I said, all our programs are computerised

But how? I queried Do you mean scheduling script copying electronically controlled or what?

Oh nothing as complicated as that he haughtily threw back Only the important bits the storylines

Of course I felt a gentle tugging of the lower limb and was about to remove myself from his presence when he offered to show me a copy of such a storyline writing program written for the BBC computer (what else!)

True to his word he appeared a few days later clutching a wad of two sheets of printout paper and eliciting a promise of secrecy let me have a look So before you read the Spectrum conversion I made and have printed around here somewhere take your Spectrum manual in your right hand and repeat these words

"I promise not to tell another soul about this program Now cross your heart and hope to die

```
    1 REM storyline program
for FULL GIRLS FAMILIES HOUSE,

Meanwhile

We decided to feature the serious side of computing in this issue some of the applications which help us in our daily struggle to make life easier in work or play

Programs reviews and articles abound on this theme but never fear we haven't forsaken all else Games programs and reviews get their share of the space regular features articles and hardware news and gossip all have their place and can be found within these pages

The Great Debate

Dear Sirs

Your Mrs Brooksbank who writes in defence of hex seems to misunderstand I am not roundly condemning hexadecimal I just meant that the average person who understands and programs in Z80 machine code (not to be confused with assembler) can read a decimal listing almost as easily as he reads the printed page If there are addresses to figure that's what the computer is for I find programming in machine code far from being difficult or forbidding Once you understand computer logic it all becomes quite elementary I have no problem dealing with binary in those programs that require bit manipulation such as graphic programs and those that translate characters held in a

horizontal eight bit file to a vertical seven bit output for a printer. But when I need to find out how a machine code routine works maybe in order to modify it having to translate each byte from hex to decimal (I think in decimal I program in decimal and when I use a Sinclair computer I enter my code in decimal) I find it impossible to follow the program past the first five bytes.

I have found hex to have its uses such as in music programs where you need two full octaves of one byte notes and other places where nines is not enough. However in all honesty I cannot see where it does much to simplify Sinclair listings or enhance their readability. Besides hex loaders use much more memory than a simple decimal loader. I have always tended toward lean mean code. Now of course here we are talking hacking. The time and care invested in a hacker's routine would never be tolerated in a business environment employing so called professional programmers though in my experience I have found if you take away the assembler and book of algorithms from these professionals the majority would not even be able to write their own names.

Well I have rambled on long enough but I am still looking for a good reason for hex in Sinclair listings.

Sincerely yours
Ulysses B Adams
Philadelphia USA

Kempston E

Dear Mr Elder
Following the publication of my letter in the current issue of ZX Computing I thought that your readers might be interested in the sequel to my problems with the Kempston E printer interface.

Shortly after writing the letter I found that the interface was not compatible with microdrive. Mr Archer of Kempston was extremely helpful and agreed to change the interface free of charge. He also customised the Eprom code to enable the screen dump facilities to match my Star DP515 printer. What a difference! (I can even customise the characters as the heading on this letter indicates).

Whilst I'm in the mood for singing praises I would like to mention that I purchased a Rotronics Wafadrive at the beginning of the year which is a lovely little machine once you learn to handle it. I overcame its one deficiency (no screen dump) by plugging the Kempston interface into the back of the Wafadrive. It works beautifully provided that the printer is not switched on and off while a program is running. I also occasionally connect my daughter's Silver Reed EB 50 typewriter to the Wafadrive's centronics port. It's quite fascinating to watch it drawing merrily away and changing colour from a Basic program.

Using the Kempston Interface in this way means that you can't use Softek's Spectral Writer. I contacted them to see if it could be modified but they were not interested — almost to the point of rudeness. By contrast I contacted Martin Idle at Tasman who couldn't have been more helpful. He promised to send me instructions to modify Tasword 2. These duly arrived two weeks later took about 20 minutes to implement and the program's been working perfectly ever since. I certainly know which Software house to support in the future!

Baldock
Herts

Sorry about that

Dear Ray
It's ironic that the contents page of the October/November issue of ZX Computing you should have credited me with the authorship of John Ure's item on peripheral problems for I had tried to phone him as soon as I read his earlier article. However each of the three Ure's in the Birmingham directory denied all knowledge of him! It is ironic for I was going to pass on a similar information to that in the current issue. I too had had similar problems to those he described after a while Tasword crashed usually with about an hour's work wasted. The crashed rapidly became of increasing occurence and were exacerbated when a Discovery Disc unit was attached. In spite of its beefed up power supply. A local shop sent it for repair three weeks later it was returned. No repair has been done they said it was working to specification. I then discussed the problem with Mancomp a firm which frequently advertises and subsequently sent it there. I simultaneously asked for a spare Z80 chip for a spare Spectrum I wish I hadn't bothered to ask for this. The total bill was extremely reasonable for the work done and each of the several replaced chips had been removed from the printed circuit board incredibly neatly with a solder sucker and replaced with a chip in the proper chip holder so that defective chips can be immediately replaced if anything goes wrong again. I could not hope to approach his standard of work and will probably take my spare Spectrum to them for professional repair with the chip the sent me!

Incidentally the repair took only three days a matter of great relief to me since I had about half a dozen unfinished articles of one sort or another locked up in Tasword files.

I can recommend this firm unreservedly for their efficiency in finding the fault (yes it was among other things the ULA again!) their workmanship and their service.

Yours sincerely
D A John Wase

Full screen$

Dear Sir,
I noted with interest the letter in your August/September edition explaining how to copy a full 24 line screen from the Spectrum to the printer. The letter however appeared to be incomplete.

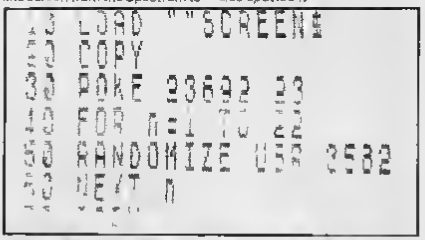
It is possible to copy a full 24 line Spectrum screen to the ZX printer without resorting to machine code — just one ROM routine will do the trick. The routine below will COPY the first 22 lines normally, then scroll those 22 lines off the top of the screen, leaving only lines 23 and 24, now moved up to the top of the screen. The next COPY command then starts to copy the whole screen at which stage you can use BREAK after the two lines at the top have been copied.

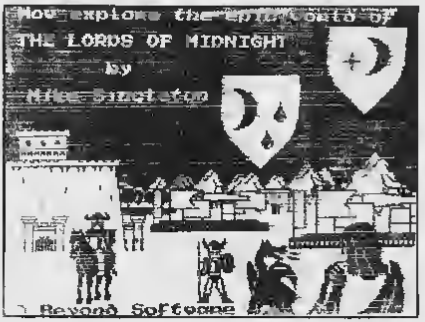
As well as a listing I have included two screen copies to illustrate that the routine does work.

```
10 LOAD      SCREEN$
20 COPY
30 POKE 23692,23
40 FOR n=1 TO 22
50 RANDOMIZE USR 3582
60 NEXT n
70 COPY
```

Yours faithfully
R Thomber
Lancashire

Er — yes funny you should mention that the original author also spotted it





Sorry!

Dear Ed
You have missed it!
Yes you have printed my letter on 24 line screen copy routine however you have forgotten to print the routine itself English magazines don t come to Turkey very regularly so I could not write this correction letter before
Now I m re writing the routine probably with a slight difference to the one I sent before
I hope that this letter is not late or that you have realised the mistake
Yours sincerely
Turgut Aydin

50 RANDOMIZE USR 30000: GO TO 50
```

Spectrum Disassembler

Dear ZX Computing
S H Man's useful program (Oct/Nov 1985 pp 96 99) needs two improvements
The first is to allow for the Definition Byte that always follows RST 0008 in a Spectrum machine code program The simplest way is to alter the RST 0008 of line 2210 to RST 008 #
The second is to work out and print the absolute address for relative jumps for no one wants to have to bother with Hex arithmetic to find out where relative jumps go to This can be done by adding the following lines

```
145  IF C$ = "39" THEN IF C$(2) = "0" OR C$(2) = "8"
     THEN IF C$ = "DF" THEN GO TO 4000
3950 DATA "DJNZ","JR","JR NZ","JR Z","JR
     NC","JR C"
4000 RESTORE 3950
4010 FOR J=0 TO INT (BYTE/8) 2
4020 READ I$: NEXT J: GO SUB 960
4030 LET Q=A: LET Q$=A$
4040 LET A=A+BYTE (256 AND BYTE 127)
4050 GO SUB 950: LET I$=I$+A$
4060 LET A=Q: LET A$=Q$: GO TO 350
```

W E Thomson
Aldeburgh Suffolk

McGraw-Hill

Dear ZX Computing,
Thank you for publishing my plea with Randle Hurley s 'Spectext' wordprocessor program from The Spectrum Workshop — Word processing and Beyond published by McGraw Hill
In fairness to McGraw-Hill I must relate what has happened since I last wrote to you In response to a second letter McGraw Hill sent me a free tape of the program This too was faulty but they replaced it and I have been using it without difficult for two months
It may have taken several months to get it right but full marks to McGraw Hill for their generous after sales service!
Yours sincerely
Jul an Blackmore
Norfolk

Crash?

Dear Editor
First to express my sincere appreciation of your excellent publication Especially in these hard times of home computing with so many manufacturers going through financial difficulties I cannot help but notice the drastic reduction of advertisements in ZX Computing and other UK publications You must certainly be commended for keeping up with an excellent magazine without decreasing the amount of editorial I sincerely hope that you will be able to continue to do so
Referring to the amusing article What Does It Do? by John Ure in the Aug/Sept issue, I may be able to throw some light on his problem
Is his problem a freeze up when using *Tesword* on his set up? When this happens nothing can be done except start from scratch Then it is not the *Tesword* program but the Fuller keyboard
This was my problem and I reverted back to a DK Tronics keyaboard I have (minus space bar from the archives) and no more freezes have been experienced by me since
Having read the article made me realise that it was the keyboard and I will be writing to Nordic Keyboards who I believe are the distributors of the Fuller keyboards to see if they can help us out. I am really missing my Fuller keyboard and to my mind it is the best keyboard available for the Spectrum with its single key entries for full/stop comma cursors and delete extra shift keys for the mode keys certainly is a pleasure to use That s if it works
Yours sincerely
Fred Bruggink
S Afr ca

Cribbage

Dear Sir
Your two part programme IQ Test was superb and works like a gem my compliments to Greg Turnbull
I have two criticisms and corrections which I d like to share with other readers who may have typed it in

1) Once someone is busy doing the test it s terribly simple to forget which question number you had just attempted thus quite easy to skip one or two By adding one simple line the current question being attempted is displayed on l ne

```
145 PRINT AT 0,28 "AT
0,28 Q 8"
```

2) The other snag is that the real time clock will only stop the game if MIN = 30 That is to say if someone has taken 31 minutes it just keeps on going! The way out of this is to amend line 1055

```
1055 IF MIN =30 THEN
GOTO 1950
```

ZX Computing is still the best magazine of its kind one can buy — keep up the wonderful work And by the time this letter is printed it will be time to wish Ed staff and readers a Happy Christmas and a Happy New Year
Sincerely
Laurence Creighton
S Africa

Deletions

Dear editor
Norman Green s article in ZXC 2/7 about deleting programmes was a useful one also to us ZX81 owners We can use the same machine code programme only that we call some other addresses in the ROM Call 6510 should be replaced by Call 2520 and Call 5629 by Call 2653 These are the routines that Ian Logan calls LINE – ADDR (0908 hex) and RECLAIMING (0A5D hex)
Even some sort of merging is possible on our ZX81 If you use a memoblock that allows for data to be stored in the 8 16K area then you can store your favourite programmes there before you load the programme you are going to work with You will need to think out a method to fetch exactly the programme you want from the store and then you will be able to enter it into the programme file by using some combination of the LINE = ADDR subroutine and another one which Ian Logan calls MAKE ROOM (2462 dec = 099E hex) This method also enables you to squeeze more data into your RAM since the programme file only needs to contain one or two programmes at a time — It makes less than a second to have a programme merged in that way
Finaly here is a simple decimal loader that makes it easy to deal with numbers bigger than 255 First you enter the address where the mc is to start and then the decimal codes You will have to use STOP to get out of the program again

```
800 INPUT K
805 PRINT K
810 INPUT N
815 IF N  255 THEN GOTO
    850
820 POKE K,N
825 PRINT N
830 LET K=K+1
835 GOTO 805
850 POKE K,N-INT
    (N/256) * 256
855 PRINT N-INT
    (N/256) * 256
860 LET K=K+1
865 PRINT K
870 LET N=INT (N/256)
875 GOTO 820
```

Yours
Johannes Lind

Odds and ends, letters, and company info

A New Insight?

Insight are a new company to us and they have sent three of their programs along for review VECTRON BUCCANER and STAR FIREBIRDS are the titles and all are arcade games priced at £7 95

Star Firebirds is an arcade clone where you dodge L/R firing at swarms of awkling alien birds which destroy on contact and also drop bombs Mega bombs sometimes appear to add to your problems There are many levels and features and play gets fast and furious

Buccaneer is not a pirate game but a sidewaye scrolling aeroplane game which introduces aliens to an earthly landscape Again control is simple up/down and fire Some good touches such as docking to replenish fuel and shields and the action is fast and furious

Vectron is a most impressive 3D perspective maze game with similarities to the film Tron There is an option to overlay the map which gives information on enemy positions and power sources but while this is showing you cannot fire your weapons

However the games can only really be described as average to play Buccaneer and Firebirds due to the limited action — dodge and fire and Vectron due to the difficulty of play It is so fast it is almost impossible This makes the asking price far too high around £5 00 would still be expensive and probably a lower budget price would be most appropriate

Back To School

ST BRIDES School software had me bemused at first and I am still not sure how to take their press releases They are so convincing that I am starting to be drawn in to their fantasy world One day I'll persuade my boss to finance a trip so I can see for myself

Meanwhile their second program THE SNOW QUEEN has impressed us in the brief time we were able to run it on our Spectrum In two parts plus a novelette version of the story, it is a text adventure with graphics and features the compulsive humour and wicked problems which were evident in their first game

Actually mentioning Snow Queen was just an excuse to print a part of their press release showing the author, Priscilla Langridge in some of her many guises

BYTTEN by the BUG

Bug Byte was a well known and respected software house who were taken into the Argus fold Their re emergence will be welcomed by many

Their first new offerings are three arcade games BOMBER BOB ZOOT and DOGSBODY and a four part massive adventure game called the LUDOIDS

All these are priced at £2 95 and whilst not state of the art programs represent good value for money Zoot in particular is a platform game with a difference you don't jump but move complete with platform section down left or right Depending on which screen you are on your task is to punch trap collect clear or dodge On more advanced levels combinations of these actions are required It is a game which requires thought and reflexes and is well presented with good animation

Bomber Bob has you defusing bombs in the White House by bouncing around the maze like screens Nasties get in your way and cause your demise and again fast action and good graphics are used Ludoids is a mind bender of an adventure game which you need to complete in sequence before moving on to the next stage use of an elusive password ensures this

Welcome back Bug Byte

Chat

News and comments from the software scene

● Martech have released a computer program based on the highly successful Channel Four T V Series THE LIVING BODY

The Living Body will cost £14 95 from high street stores and computer shops

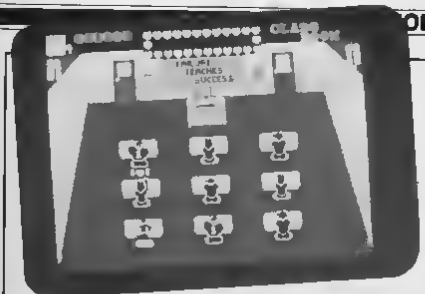
● Fancy a bit of a wreck creation ? that s what Anolasoft UK Ltd is promising with PANZADROME

The concept is deceptively simple the Panzadrome is an Island inhabited solely by robot tanks with varying levels of intelligence and viciousness Your aim s to destroy it completely

In Panzadrome over 200 enemy tanks mines and mortars offer literally hundreds of ways to get yourself killed And all against a special totally wreckable Panzadrome background (which you can repair with Polycrete) Panzadrome costs £7 95

● BALLBLAZER is a recent release from Activision The year is 3097 and you are a contestent in the final round of the Interstellar Ballblazer Championship For the first time a Terran has battled through the countless qualifying rounds to compete for the honour of his planet and the ultimate title any being can possess Masterblazer

Two players can play simultaneously or one player can take on one of nine practice Droid players each with differing levels of skill Available for £7 99



Imagine Twosome

Imagine software in conjunction with Konami have released Mikie and Yie Ar Kung Fu

Set in an American high school the player takes on the role of Mikie the school romeo Mikie is trying to send a message to his girlfriend but the teachers man ac janitor and canteen chef are out to thwart his efforts

The player must manipulate Mikie through the school s classrooms locker rooms canteen gymnasium and eventually the school yard You have to collect hearts in these sections and each heart represents a letter in Mikie s message which will be depicted at the top of the micro screen

Once the message is complete the bell rings and Mikie can move on to the next section Single hearts can be found on the floor or under stools — any class mates can be moved over with a Hop Zap — a pelvic flip accessed via simultaneous use of the direction and fire controls

Assailants can be temporarily stunned by assaulting them with a chicken (!) or basket ball But beware of the dancing cheerleaders One kiss can render Mikie temporarily inactive! Even though this may appear a dated plot the game is great fun to play

Yie ar Kung Fu s scenario is set in Japan and the action takes place against two colourful backdrops — The mountain scene and the temple

The objective of the game is to develop Kung Fu proficiency and become the grandmaster in the traditional martial arts skills The player takes on the role of Oolong who is set on becoming a grandmaster in order to honour the memory of his father To achieve success Oolong must master the techniques of the sixteen different kick and punches — controlled by the player via the joystick or the keyboard

Eight honourable opponents equipped with fearsome weapons await Oolong including Star a female warrior who can kill with a judiciously placed Shuriken Blues is the resident Kung Fu master if the player can KO him then the Grand Master title is his

Yie Ar Kung Fu can be played via the joystick or redefinable keyboard controls Each costs £7 95

• DESERT RATS simulates the North Africa campaign in 1941 42 from the arrival of Rommel in Tripoli to the Battle of El Alamein The bitter campaign includes Operations Battleaxe and Crusader and the Battle of Gazala

It is a fast interactive wargame with a scrolling map and six compelling scenarios for 1 or 2 players The game is packaged in an A5 video case comes with a detailed instruction booklet which includes historical background notes on the campaign with maps and photographs and is priced at £9 95 from CCS

• SUPERMAN continues his constant battle to save the world Darkside the arch enemy of mankind thirsts for universal domination but he needs the anti life formula This awesome key is imprinted in the minds of certain humans Darkseid is on earth now and plots a reign of terror to achieve his ends Only Superman (and you) can stop him

So gather your wits put your powers of concentration and courage to the test to help Superman foil Darkseid s dasterdly deeds Available from US GOLD at £7 95

• THE WORM IN PARADISE is now in the shops 200+ pictures are included and it s the first game to use LEVEL 9 s new adventure system

• Bubble Bus have released a new budget game BRAINSTORM at £1 99

Escape from Professor Brainstorm s Castle is your only hope of survival The game is an arcade/adventure with 650 different locations 28 varieties of Clones 62 doors to find and open using keys that are scattered around and 8 guardians of the tower — The Fire The Plant The Wolf s Head The Eagle s Head The Snake The Teapot The Boot and The Light Bulb

Each one must be destroyed in turn by an appropriate weapon There are 16 weapons in all but eight are red herrings Only three keys may be carried at any one time and only one of the special weapons At the bottom of the screen there are two guages one for Energy the other for Damage Each time a clone hits you your Damage reading goes up this can be repaired at the costs of some energy or by finding a repair damage pod If damage reaches maximum you loose a life

Energy can be replaced by finding energy pods but if you run out of energy your laser will be disabled Extra lives may also be found

Friday the 13th

A quiet holiday camp at Crystal Lake is disturbed when one of the campers Jason is drowned His mother distraught with grief blames the other campers who did nothing to help him

She vows revenge and murders all the holiday makers except one girl who kills her The survivor floats into the middle of the lake where Jason rises from the water to take his revenge Your task is complicated by having to find a sanctuary identify and kill Jason who appears as a normal camper In this new game from Domark who produced A View to a Kill and Eureka

The price is £8 95 and there are five Eureka colour monitors to be won in a free sound effects competition The unique feature of these monitors is their ability to expand the game play area to fill the whole screen!

Each game tape has 10 sound effects recorded after the computer program By identifying these sounds the purchaser has a chance to win one of these colour monitors

Astronomer's software

The book boom seems to be dying off and most new publications seem to be for various specialist markets. This one is no exception.

Written by Robert A Mackenzie and published by Sigma it is a collection of Spectrum routines to perform the various calculations needed by all devotees of the subject.

The main programs are to enable astronomers to make predictions about the positions of the sun, moon, planets, satellites, stars and meteors and analyse observations. A wealth of information is also given.

Very useful and Mr Mackenzie's pedigree (he is founder and director of the British Meteor Society and a fellow of the Royal Astronomical and British Interplanetary Societies) lends weight to this book. It will cost you £8.95.

Microcomputer Games Design

Subtitled "for education and entertainment" this book is not a book of listings, but a general reading book for everyone interested in programming.

Michael Rigg wrote it and keeps the tone light but discusses many of the aspects of this phenomena. Ideas are thrown out virtually from every page and, though you may not agree with all his statements at least there is plenty of food for thought.

Not only does Mr Rigg cover the logistics of games design he also discusses languages, programming, specific utilities and programs such as Quill, Devpac and many more.

Here is that rare thing, a non specific book which could even revive the jaded attitude of yours truly and reinstall that sense of excitement that I first had with the purchase of my ZX81.

At £6.95 from Sigma press I recommend it to you.

Comets

In the series called Computer Club, this is much less weighty than Astronomer's Software and is more at my level. A modest, a much more general reader this is beautifully presented with fascinating facts and information, eye catching illustrations and simple demonstration programs.

The book is published by Macdonald at £5.95 and a tape of the programs can be obtained for £3.95 if you do not fancy entering them yourself.

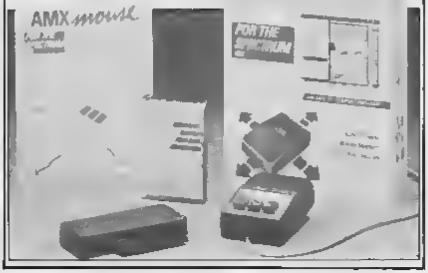
This series is great in that they make a reasonably successful attempt to combine computing with other topics and hobbies. Invaluable in schools and with an appeal which covers all ages. I recommend that you try and look them out at your bookshop.

A Mouse in the House?

On more expensive computers the use of a mouse for control, graphics and utility programs has been making some impact. Advanced Memory Systems have now produced their AMX Mouse for the Spectrum.

This neat little device comes complete with an interface which includes a Centronics printer interface and AMX Art a drawing program and a good selection of utilities to enable it to be used in your own programs with the minimum of effort.

Available from AMS at Green Lane, Appleton, Warrington WA4 5NG for a very reasonable £69.95 this could enhance your pleasure and operation of your computer.



A Foxy keyboard

With the production of the Spectrum+ sales of keyboards have dropped, however Fox Electronics Ltd of Fox House, 35 Martham Rd, Hemsbury, Norfolk have brought out a new model based on their popular keyboard.

Most serious Spectrum users are still not satisfied with the keyboard supplied and this one from Fox is definitely worth considering if you want to improve your machine.

The 68FX2 Deluxe model is a very smart looking keyboard which at £49.95 is very reasonable. Featuring 68 good quality keys which have a solid feel and satisfying click to them. Fox have done their homework well and all the peripherals we could find to try out operated perfectly with it. This includes Interface 1 and Microdrives.

The wide variety of additional keys are well planned and laid out and include Single Entry, E Mode, Caps Lock, Graphics, Run, Break, Delete, Edit, Dot, Comma */

A numeric keypad is also featured along with the essential full sized space bar. One criticism I have made in the past is the stick on key labels usually used on cheaper keyboards. The Fox unit has properly engraved key tops.

It is a useful size, 16 x 7 x 3 inches with a slope from the rear to the front. Fitting is very simple and the instructions are idiot proof, no need to feel worried about tampering with your machine if you are a complete newcomer.

The features it offers for the price asked makes it one of the best buys around at the time of going to press.

All Purpose Transfer Unit

Great news for all frustrated owners of storage media other than tape. A T and Y Computing Ltd have produced a unit which will provide a Ram Image Transfer Interface (RITTI) for most devices. Microdrive, Wafadrive, Technology Research Beta disk drive and the Opus Disk drive.

An RITTI makes a complete copy of the Spectrum's RAM and so in theory any program which has loaded, regardless of the protection built in, should transfer.

We had a quick try of the SPEC MATE as they call it and it performed well with the Wafadrive, Microdrive and TRL units which we have in the

Get lost with Wally, Wilma and Herbert and make enough money for your dream holiday next year.
Three Weeks In Paradise is the latest Wally venture following hard on the heels of such successes as Pyjamarama. Everyone's a Wally and Herbert's dummy run.

office. It is well designed and operation is simplicity itself press a button and select the option for the device required and it does the rest. There are also options to save in special formats.

Well worth considering, although it may be worth bearing in mind that every time a better mouse trap is invented the mice soon get smarter!

Available from 35 Villa Rd London SW9 7ND

● DEATHWAKE is the latest from Quicksilva. Set in the final stages of a terrible war, the player as admiral in chief has the awesome task of restoring the homelands morale and preparing for the great victories needed to regain lost territory.

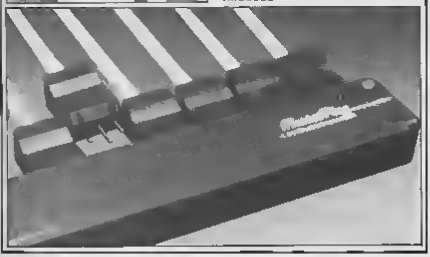
Arcade action and more than just a subtle hint of strategy combine to make Deathwake a game to watch out for. Deathwake will cost £7.95.

Socket top me!

A rather upmarket system is the one from Coniblock electrical Ltd. who provide a six way, mini plug mains board complete with plugs and a four into one wall plug featuring the same plugs and which are therefore interchangable.

The six way unit contains PCB's which help to reduce the weight by some 60%, and the size by some 30%.

Available in most electrical stores, all Coniblock need to do now is to get their press agents to include the price on their press releases.



Philips monitor the market.

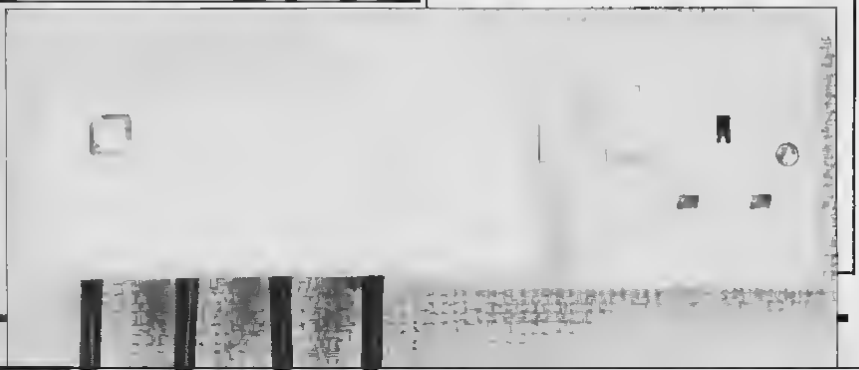
Philips have introduced a new range of colour monitors for a wide range of computers. QL owners may be interested and so may fanatical Spectrum owners.

A choice of composite video or RGB is offered, but on the two top of the range models both are included as standard. Unlike computer prices, Monitor prices have remained pretty constant and at £220, £245, £280 and £325 for their CM8500, CM8501, CM8524 and CM8533 respectively they are not overpriced. Pictured is the CM8524, a standard resolution model.

A plug for duraplug

If like me, you end up wondering where to plug in all your bits and bobs, computer, TV, Tape recorder, possibly a printer and disk drive, then Duraplug have come up with an alternative to the bulky square adaptor or long four in a row socket.

Called the MultiLine plug, you wire four units directly into the plug, it even features a 'main' on indicator light. It looks to be a very useful unit and at around £5.00 it's nearly a quarter of the price of buying a four in a row and four 3 pin plugs.



'Hardware'

'ZX looks at some new add-ons for the Spectrum.'

We are used to extravagant claims here at ZXC and when this small wedge shaped bit of plastic with an edge connector on the thin end arrived we were not terribly excited. Evan Rodney Holland's glowing letter — extraordinary grand title product over £16 000 and eight months to develop — only raised a knowing glance.

But as a serious programmer on the Spectrum I was in for a treat, this is a little marvel!

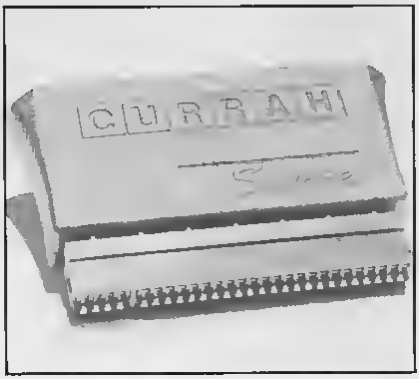
What is Microsource? Well it is really three units in one which combine to produce one of the most powerful tools for the dedicated programmer. The unit provides you with an ASSEMBLER a FORTH interpreter and a versatile DEBUG or Monitor.

Accompanying it is a 38 page manual which provides all the instructions needed to operate the beast and is satisfactorily clear and concise. As with all similar programs no attempt to teach machine code or FORTH programming is made and the user is either already proficient or will have to learn from another source.

The assembler produces stand alone code which is portable while the FORTH interpreter is machine (or unit) dependent. Both can be used from within BASIC and commands for each are held in REM lines. Assembler prefixed by ! and FORTH by # and BASIC variables can be used to pass parameters to and from either.

The assembler is a two pass assembler and all Z80 Op codes are supported plus a wide selection of pseudo op codes such as DEFB DEFW etc. A useful feature is the way in which operands can be typed as BASIC expressions. When the assembler is called (by LET assemble=number) the whole program is scanned and ALL code irrespective of its position within the program, is compiled. This can be assembled as a direct command or during RUN time.

The FORTH used is an implimentation of FORTH 79. is 16 bit integer and also has some unusual and useful features such as allowing the USR command to call machine code.



Unlike the assembler, the FORTH compiler only compiles the code following the command most usefully from within a program and stops when it reaches the next Basic command.

The only disadvantage with this language is that you must have a Microsource unit attached as unlike the assembler FORTH does not generate code which can be used independently.

Finally the Debug utility is easy to use and performs all the tasks you are likely to require from such a program including single stepping breakpoints and memory manipulation.

Any of these features could be obtained as individual programs but apart from the constraints of having to load them and the memory they would occupy having all three together and available instantly makes the Microsource very powerful. You could for example write a program in Basic and then modify sections to FORTH or assembly so that all three types of code exist in the same program yet still be able to run and use it.

A tremendous amount of thought has been put into this product it is compatible with microdrives and Interface 1 and commands and options are included to make the best use of them. I really have nothing but praise for this device, but I did find that sometimes my bad habits caused some confusion for instance I wrote JRNZ label. The assembler insisted on the form JR NZ label but thanks to the extensive error trapping I soon got to know its requirements and this really is a small quibble with a well thought out unit.

I have no hesitation in wholeheartedly recommending this unit to anyone who takes their computing seriously.

Big Beeps

The Soundboost unit from SSL is a small circuit board with three coloured leads ending in press on clips attached to it. The circuitry modifies the Spectrum sound generation and outputs it through the TV speaker tough luck if you've lashed out on a proper monitor!

Attaching the gizmo was very easy but may cause concern as it means you invalidate the guarantee by opening the Spectrum's case. Unscrew case screws, separate case halves, position unit and attach leads as per instructions — which include a good diegram for those among us of a nervous disposition — and Bob's your uncle.

Before reconnecting the two halves of the case it is worth entering a BEEP command, turning up the TV volume and then adjusting both the TV tuning and a little fine tuning on the unit to get the best sound you can.

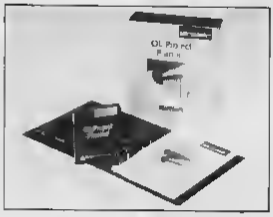
Fitting is that simple and it worked. Unfortunately the sound is very poor. I tried it on two Spectrums, each with its own different TV. Tuning is a very precise job but even at the best possible combination of settings the background noise was so high as to be extremely irritating. When the volume was lowered so that the background hiss was unobtrusive than the level of sound was only about twice as loud as the Spectrum beeper.

Worse was to follow over the next few days the unit and the TV consistantly needed to be re tuned and I was beginning to experience SAVE/LOAD problems. I'm not saying the unit caused them, but when I eventually gave up and removed it they disappeared — coincidence?

From the company who have produced possibly the finest keyboard for the Spectrum and one of the most exciting graphics aids in the Graphics Pad this was a great disappointment and at £9 95 cannot be recommended.

Ray Elder

QL Business Software



Good software of any description has been slow to appear for the Sinclair QL. But as the QL was primarily intended as a business micro this software famine has had a particularly deleterious effect on QL sales. Fortunately business software is starting to appear. One of the first producers is a company by the name of Tri ptych Publishing. They have produced a series of packages called the Brain power range. There are currently three programs in the range for the QL: *QL Entrepreneur*, *QL Project Planner* and *QL Decision Maker*. These packages each cost £39.95 and are sold under the Sinclair label.

All these packages are sold in the standard Sinclair 'black box'. Tilt the box and a loose leaf folder drops out containing the instruction manual and microdrive wallet. Each package is supplied with four microdrives, these being a mixture of training courses, application programs and one spare cartridge for backup. The applications will not work without first backing up the program, but you have to find the information at the back of each manual on how to do this.

Each package is primarily intended as a training course, but you also get one or more application programs which allow the user to put business theory to practical use.

Entrepreneur

Entrepreneur is aimed at the embryonic businessman. It tries to focus the mind on how to start a business. The 128 page manual is easy to follow. It starts with a very comprehensive list of items which the potential entrepreneur must address to form his or her business plan. The list is so long that it is sure to put off all but the most resolute, but highlights the fact that tremendous thought and planning must go into a business idea if success is to be achieved.

There is one tutorial program with *Entrepreneur*, this explains the principle balance sheets. If you know absolutely nothing about the subject then following the manual and the well formatted screen displays you should acquire a basic knowledge in a couple of hours.

Entrepreneur's two application programs are similar, they allow you to develop a financial plan of the future business. In so doing several financial concepts are introduced and explained well. The programs (one is for a single product business, the other for a business with multiple products) expect you to enter all the relevant information. Questions are clear and they are carefully presented as a checklist in the manual. The program then analyses all this data to produce a series of financial reports. These will tell you if your plans are sound or if some modifications are needed. Your bank manager should be sufficiently impressed to grant the loan you need to get started! And if you're just an armchair entrepreneur, then there are some examples in the book to try, they'll give you a surprisingly good feel for the demands of setting up a new business.

Getting started

Starting a business is one area where you need a sound plan of action as well as finance. You'll need action plans for any project once the business is off the ground too. If there are several activities in a project which are interdependent, all requiring time and effort, then you'll need to plan the most effective sequence of actions in order to complete the project in the time allowed and within budget. The technique of critical path analysis is one powerful way of planning and controlling a project and *Project Planner* teaches you the principles of this technique on two tutorial microdrive cartridges (again, used effectively with the manual). A third cartridge gives you an application program to plan your own project or to just try one or more of the examples given in the manual.

By telling the computer the activities which will be involved in the project, how long they will take, how many people will be involved in the project and how the activities interact (e.g. which jobs must be completed before others can start) a network is constructed. Where you have more time to complete a job than the job should take, you will have 'float' (spare time). But there will be one or more series of jobs where there is no time to spare; there are the critical activities, and the planner knows that he has to manage these more carefully to ensure that the project goes to plan.

Project Planner presents the network to you in a number of ways as a network, bar charts or tables. If you decide to alter the plan (you have a bright idea on how to improve the plan) then you can alter the design and logic of the network, get a new set of analyses from the computer, then decide for yourself exactly what will be the better option.

Again, *Project Planner* is excellent for the business student who should gain a very good appreciation of the principle and practise of network analysis. It also allows the user to develop and refine plans before the start of projects. Its limitation comes compared with far more expensive project planning programs on 'real' business micros is the apparent inability to help in the management of on going projects. Once a project is under way, inevitably there are problems, or on the other hand activities which are completed faster than planned. There appears no way to feed status information into program, and receive reports on their effect on the network. The printout of the jobs list in the form of a table or bar chart is available. Unfortunately critical activities are not highlighted on the printout (although they are on the screen), so it's a bit difficult to find them in a long list. Bar chart printouts are hard to read as they lack a grid to help you judge the position of bars. Still, the program doesn't cost $100+ as others do, and too much should not be expected. But these are limitations of which serious users should be aware.

Decision Maker

Perhaps the one program of the three which could be used by both students and businessmen alike is *Decision Maker*. The program is based upon the principle of decision trees and risk analysis. Any decision one makes can have a number of chance outcomes, each one of these may require further decisions or result in more outcomes, each with some probability of actually occuring. So from one decision stems several outcomes and further decisions, drawn these diagrammatically and you get a decision tree. Add the costs (or profits) associated with each outcome, and hazard some guess at the probability of chance outcomes actually occuring, and you end up with all the requirements to calculate the best decision. To check that the decision is best, two further techniques called 'risk' and 'sensitivity analyses' are applied by the program.

In actual fact the mathematics involved (and all the program really does for you is to do the sums) is quite trivial, and once you know the rules, then most simple decision trees can be solved in a few minutes with a calculator. The logic of constructing and decision tree, and adding the required data are left entirely to you, but of course the program helps to draw (and produce on a Epson printer) some neat decision trees, and if you dislike maths, then all the hard work is done for you.

So, in much the same way as the other members of the Brain power series, *Decision Maker* is a computer aided tutorial system with a relatively unsophisticated application program which allows the theory to be applied. As tutorial packages all three are excellent although the price of each must be considered high when compared with standard text books on these subjects. All three application programs are somewhat limited, but again serve the student well to practise the theory supplied by the tutorial programs. But work horse business programs, unfortunately they are not.

Alien!

A Strange Being has been spotted by Nicholas Pearson as it searches Potters Bar for a working telephone.

This is a great game for younger members of the family (*I liked playing it! — Ed*). The idea is to guide the telephone which continually descends from the sky (A UFOne?) onto the head of the wandering non terrestrial. No you are not trying to brain him but provide him with the means to communicate with his home planet (have you seen the telephone company's Intergalactic charges?)

After each attempt whether you win or lose the player has the option to play again immediately (if he's impatient) or to see the appropriate end of game graphics. And finally for those who are very slow there is a 'Hold the phone' feature which slows the game down. Brief but complete instructions are given by the program so you've seen the film, read the book now etc. etc.

NB. Is a telephone engineer a phoney?

The WINNERS

of the ASP DREAM HOLIDAY Competition

As seen in the national press

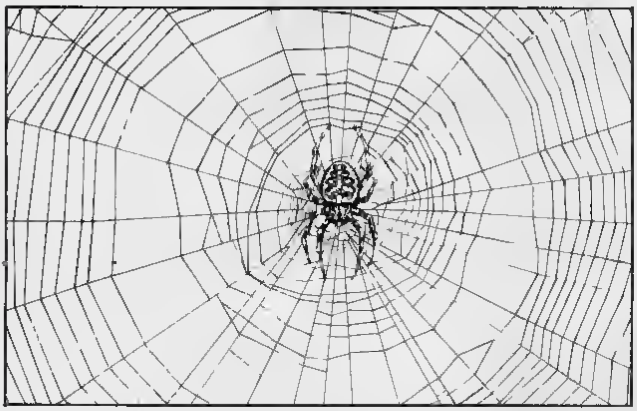
WIN a DREAM HOLIDAY in our GREAT COMPETITION

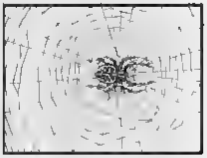
Argus Specialist Publications Ltd are pleased to announce the winners of the fabulous Dream Holiday Competition.

"...to combat boredom by the beach, keep magazines in easy reach!"

Spiders!

Keith Burton has a close encounter of the arachnid kind.





As caretaker of Spectrum Manor you have to keep the building clear of spiders and clear up those nasty creepy webs. There are three floors to patrol and some idiot has left three invisible mines on each floor! Fortunately as you enter each floor the mines become visible for a few seconds so that you can make sure you avoid them. The spiders being very light footed do not trigger off the mines.

You have three lives to risk and cleaning up a piece of web scores one point. Dead spiders the non fleshing kind also score one point but live spiders score a generous twenty-five points. If you are one of the top five spider exterminators then you are rewarded with having your name held for posterity in the high score chart.

So carefully positioning your fingers over the QZIP keys for UP DOWN LEFT and RIGHT do your bit for mankind in the battle against these horrid harmless beasties.

But first you have to type it in

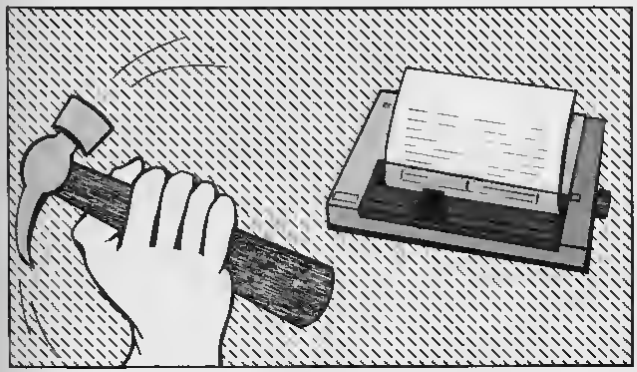
Printer Ploys

Charles A Barron gets to grips with using his printer.



So Uncle Clive has killed off the ZX Printer — one of the most useful and impressive little toys he ever gave us. But then he gave us Interface I and who can resist plugging in a real live full width printer to its little RS232 port?

But now that we all have a real printer, can we make best use of it? The first essential is some software to make the thing work properly — something like *Tasword 2* perhaps which will format our print outs with neatly justified right hand margins. But that's just a start. Do your documents involve typing the same name or formula over and over again? Well if your software allows you to seek and replace a word you can save yourself a great deal of finger tapping. For example, I spend most of my hours at my Spectrum pretending it's a word processor in order to write plays. Now the one thing you can be sure of in writing a play is that you are going to have a lot of repetitive typing every time a character speaks you need his name in full. A page of quick fire dialogue may use a character's name 20 or 30 times especially when you consider that you not only begin every speech with the speaker's name, you also have the characters constantly addressing each other by name. You've seen the kind of thing:

MURGATROYD Daphne!
DAPHNE Murgatroyd! It's you!
MURGATROYD As you say Daphne, it is I
DAPHNE At last Murgatroyd

Four *Murgatroyds* and four *Daphnes* in just four lines of deathless dialogue. Most writers cheat when writing their draft versions of the text and use abbreviations for the names. Ever noticed how characters' names always begin with different letters of the alphabet? That way we can just use the initial letter for identification in the early scripts. (We're way ahead of one William Shakespeare here. Macbeth, Malcolm, Macduff — all in one play. He must have been fonder of quill-scratching than I am of keyboard tapping.)

Once the rough draft has been cleaned up and polished you just have to use the *find and replace* function to find all your character identifications and replace them with the names in full. So the draft looks like this:

M D!
D M! It's you!
M As you say D It is I
D At last M

And the filled out version looks like the quotation above. A saving of 56 key taps in four lines!

Once the play, or whatever, is complete you'll want to give it a finished look. Page numbers. Maybe even page headers? (That is where the title of the piece appears at the top of every page.) An unconscionable amount of typing for just a little fancy decoration. And none of the software packages for the Spectrum that I've come across allows automatic page numbering. That is the only really desirable function of those £5000 word processors that is missing on Uncle Clive's little wonder. (Though by the time you've added Interface and the printer and a couple of microdrive cartridges to store your prose on, it is beginning to cost about as much as the £5000 job!)

Here is a little program that will give you automatic page numbering and automatic page headers at the cost of typing it not only once. It will only work if your printer/interface/software combination allows you to program in a form feed instruction that moves the paper through the printer one full fanfold. You should also set them to give you automatic skip over the perforations, if that is possible.

Run off your document, keeping the perforations intact, tear off the last sheet and then feed in page one again, setting the top of the page carefully to where you would want the page header to come. Set the program running and the printer will run your printed play or White Paper through again, pausing only once every page to add the titles and page numbers.

In the program listing, which should work for the common types of dot matrix printers, you will have to set the baud rate to suit your own set up, and put enough spaces into your title in line 20 to bring it to the desired position on the page. If your printer can be programmed with TAB settings, then you can use these instead of the row of spaces. The program begins by asking you how many pages your opus runs to. If you are too tired after composing the thing to face counting them, you can always lie to your computer and pretend to have written 2000 pages — it will give up the program of its own accord when it runs out of paper. (But it may never trust you to tell the truth again!)

CHR$ 12 is simply the Form Feed control code — your machine may need a different code, though that is unlikely. Refer as they say to the manual and adjust the program accordingly. As The Bat At Noon is what we call in the trade a variable, please don't name all your documents after my play.

50      CLOSE #3
```

Goblin Dungeon

In this frustrating, amazing chase game, Peter Watson mixes planning with action — you'll need a good head to go down to the depths and back!

The object of the game is to retrieve all the treasure from the dungeon without being caught by the goblins. Treasure must be collected in order, beginning at the highest level and then taken back to the green door safe keeping.

To collect a treasure you simply move your man up to the required treasure and he will then automatically start flashing in disabling pick up.

You have three lives but if caught by a goblin whilst in possession of a treasure, you are immediately killed and the game ends. A treasure that is not due for collection will block the path of your man. This is not a problem since he has five sticks of dynamite which he can use to blast holes in the floor (or ceiling if at the lowest level). To use the dynamite, move your man adjacent to such a treasure and then press the 0 key. The floor (or ceiling) will flash red leaving a hole for your man to pass through.

Instructions and control details ie cursor keys for left, right up and down and 0 to use dynamite are given at the beginning of the game. Your status is given during the game ie treasure collected, number of sticks of dynamite and lives left.

To win the game you need to use all the dynamite and entice the goblins away from the area of the green door in order to give your man time to get the treasures back (unfortunately the goblins are rather quick witted!).

The game will not fit a 16K Spectrum in its complete form. However if the title, instructions and control details (lines 7000 7210 inclusive) are deleted it should fit. Line 30 should be changed to GOSUB 9000: CLS.

Program details

The program consists of a main game loop with calls to various sub routines. Extensive use is made of the ATTRibute command and so any changes of colour on the playing area of the screen should be made with care.

The goblin co-ordinates are held in two arrays, each goblin being moved once each cycle of the goblin move loop. Fifteen User Defined Graphics characters are used for treasures, goblins, man and screen construction etc.

When the program listing has all been entered and checked it should be saved using the direct command GOTO 9990. The listing will then be SAVEd in the auto run mode followed by a request to rewind tape ready for verification.

Light Screen Designer

Part 10: by Toni Baker

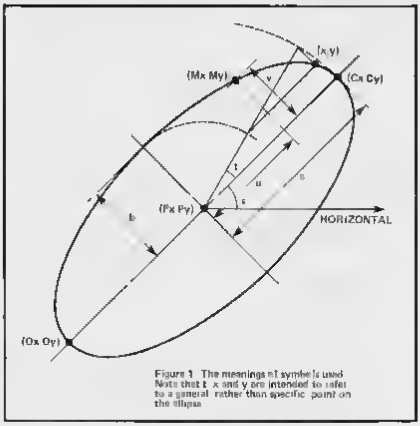

Figure 1. The meanings of symbols used. Note that x and y are intended to refer to a general rather than specific point on the ellipse.

In this the penultimate part of the Light Screen Designer program I shall be covering ellipses. The program has two ellipse procedures: ELLIPSE and QUARTER ELLIPSE. First though I'd like to talk about last issue's article. One bug cropped up which was that if the cursor was set to print in italics and cursor left was repeatedly pressed strange things would happen at the left hand edge of the screen. The bug occurred at address E45E where the byte reading 20 should have read 32.

The other error I made — a rather silly one — was that I forgot to actually link the procedure into the rest of the program! This is of course simple to do — you just store the address of the start of the procedure in the command addresses table. The alterations in figure 3 will therefore (a) cure the bug (b) link in the text procedure and (c) link in this edition's ellipse procedures as well (well we might as well while we're at it).

Ellipses

Anyway — ellipses. This is rather different from all the other line or curve drawing routines we've covered so far because it doesn't make any use of a ready made ROM routine. It can't because there isn't one. When we covered circles and arcs we were able to make use of the ROM's CIRCLE or DRAW__ARC routines but the Spectrum was never designed to draw ellipses. This is something we have to arrange all by ourselves.

The program makes extensive use of the calculator memories — in fact it needs sixteen of them. If you refer to the diagram in figure one and compare it to the chart below (figure 4), you'll see exactly how these memories are used.

If you don't understand any of the terms in the list you should be able to suss it all out by looking at the diagram. Onto the program.

The first subroutine is called ELL__SUB. This subroutine calculates the coordinates (x y) of a point on the ellipse. For each different angle t a different point on the ellipse will be calculated. The resulting coordinates will be left on the top of the calculator stack.

The next subroutine is called ELL__Q. This is the routine which actually draws the ellipse. The first thing the routine does is to calculate N which is the number of points around the ellipse needed to give a smooth looking curve. (Actually the number is 4*N since N is the number of points needed for a quarter ellipse). Then it calculates t the angle needed to ensure that 4*N points are plotted evenly around the ellipse. NB is transferred into the BC register pair and t is stored in memory three. Note that the routine will only work if memories M4 to MF are first assigned as above. Anyway the subroutine then proceeds to draw the curve by running into the subroutine CURVE.

CURVE is the subroutine which draws a curve. It is completely general and will in fact draw any curve whatsoever be it an ellipse, a spirograph pattern or a superior epitrochoid. It requires three things:

(1) That BC contains the number of line segments to be

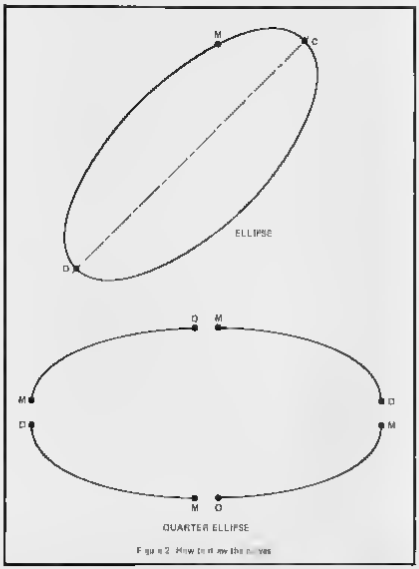

Figure 2. How to draw the curves.

E452	32	DEFB 32	Jump displacement to TEST_CPOS
DB86	61 E5	DEFW E561 TEXT_MODE	Link in text procedure
DB46	1B E7	DEFW E71B Q_ELLIPSE	Link in quarter ellipse procedure
DB5E	90 E6	DEFW E690 ELLIPSE	Link in ellipse procedure

Figure 3 Alterations to last issue's routines

drawn

(2) That HL contains the address of a subroutine which calculates the next point on the curve and possibly

(3) if this subroutine requires any quantities stored in calculator memories that such memories are initialised

CREATE_MEM will create new calculator memories. It requires that BC contains five times the number of memories needed. On return the new memories will be numbered from M0 upwards and should all be considered to contain rubbish. Note that it is usually necessary to restore all calculator memories to normal before returning to BASIC and this may be done by loading MEM (at address 5C68) with the value 5C92.

At address E690 is the ELLIPSE subroutine itself. All it requires is that the three cursors are in the right place on the screen. It works by first calculating Px and Py — the coordinates of the centre of the ellipse and then calculating a the length of half of the major axis. It then calls the ANGLE subroutine listed in part 8 to work out s the inclination of the ellipse. Next it has to work out b the length of the minor axis which it does by first working out u and v (see figure 1). It sets up the memories ready to draw the ellipse and uses the ELL_Q subroutine to do the actual drawing.

STK_REGS is quite a boring subroutine really. All it does is to put the contents of the registers onto the calculator stack in the order L H E D C B — with B being at the top.

At address E71B is the QUARTER ELLIPSE procedure. This first of all works out which quadrant the quarter ellipse falls into then sets up the memories and uses ELL Q to do the drawing.

How to use the Procedures

To use the ELLIPSE procedure you need to place the Origin Cursor and the Main Cursor at either end of the major axis with the Marker Cursor at any other point on the ellipse. Figure two will show you what I mean.

The QUARTER ELLIPSE is a little different. Whereas a whole ellipse may be drawn at any angle a quarter ellipse must always be upright (with the major axis horizontal). A quarter ellipse will always be drawn anticlockwise from the origin cursor to the main cursor. Again figure two will show you what I mean. One final thing I should point out is that BREAK will work throughout the drawing of these curves. If you press CAPS SHIFT with SPACE whilst the program is in the middle of drawing a curve then the program will simply stop drawing the curve and return to the main Light Screen Designer program.

The next article will be the final part in the Light Screen Designer series. It will complete the program by talking about painting or colouring in outlines. See you then.

Toni Baker

M0	not used	Note that memories M0 M1 and M2 are corrupted by the functions SIN and COS.
M1	not used	
M2	not used	
M3	i	The increment of the angle t on each pass of the loop
M4	s	The inclination of the major axis to the horizontal
M5	t	Eccentric angle of point (x y) on ellipse
M6	a	Half on the major axis
M7	b	Half on the minor axis
M8	Mx Px	
M9	My Py	
MA	a*cos t	
MB	b*sin t	
MC	cos s	
MD	sin s	
ME	Px	x coordinate of centre of ellipse
MF	Py	y coordinate of centre of ellipse

Mindplay

The adventure market at the moment seems to be swamped with adaptions be they of TV shows or books. This begs the question: is anyone producing original games these days? We've also got a plethora of graphic adventures which are often poor text adventures with useless pictures or so called animated adventures.

Whatever happened to Ye Olde Text Adventure? There doesn't seem to have been an original and enjoyable text adventure for ages. Is it a dead art? I'm sure the market is still there but the software houses believe a game won't sell without pictures. I'm not anti-graphics in fact they can in some cases add greatly to a game. Occasionally I'd like to take a stab at a good frustrating and lengthy text adventure but very few are released now. It's a pity because the genre is far from exhausted. Even Level 9 now add graphics to their games.

Anyday now I expect a revival of text only adventures sweeping away often useless graphics and giving us a rip-roaring plot instead with plenty of fiendish problems. Ah well wishful thinking I suppose!

Just to repeat what I said last issue, I'd like to hear from you. What do you think of adventure games in general? What about market trends and the quality of product the software house present you with? Also specific problems with adventures would be welcome. As I can't possibly play everything, offers of help and solutions to particular problems would also be greatfully received. All letters, problems and solutions should be addressed to Mindplay, ZX Computing, 1 Golden Square, London W1R 3AB.

The Never Ending Story
Ocean Software
£9.95

The Never Ending Story — was originally a novel, a film and has now resurfaced as a computer adventure game. The micro version of the story is a graphic text adventure with illustrations for some locations, all objects and some special events. The game is split into three parts comprised of over 100K of data and code. Objects carried and the current 'condition' of your character is carried from one part to another.

The use of graphics in the game is relatively unusual compared with the majority of graphic adventures. The screen display is split in two halves with the lower section reserved for the adventure's text, the graphics inhabit the top half of the screen. This itself is in turn sub divided. There is a background scene which fills the graphics area and other graphics are printed over this. These other graphics include pictures of every object in the game. Although you can only carry five at a time only five can be displayed at one time. The sixth place in the object display area is taken up with a cute picture of one of your two possible companions.

Larger screen illustrations for locations and special events are displayed in the top left of the screen. The instructions claim the graphics are not intended to replace the text but merely to enhance it. They are certainly not sophisticated enough to replace the text but the neat layout and interesting little pictures certainly add something to an otherwise lacklustre game.

As to the story itself it broadly follows the plot of the original book. The game is set in Fantasia, a world of the imagination facing extinction by the all consuming nothing - eroding its very fabric and condemning it to oblivion. The world needs a hero from the Real World (that's you!) someone who will believe in Fantasia and so save it from disaster. In the game the player takes the part of Atreyu and must find the saviour of Fantasia. Only through your endeavours will the kingdom be restored to glory. There is certainly nothing in the plot that adventurers would see as particularly original. It's another variation on the old fantasy land plot. The colour graphics add something to this game making it an enjoyable if standard adventure.

The Ludoids Adventures
Bug Byte
£2.95

This is a real-time four part adventure with animated graphics taking you on a journey through time and space to defeat the Ludoid menace. It's not bad either!

So just who are these Ludoids? Apparently they are a group of cosmic Veganistdon't ask what they are!) who have infiltrated the corrupt Newtonian Rocket Co. with the aim of disrupting the galactic Free Trade's revolutionary Trans-Mat transport system. Your aim is to hunt out and destroy Trans-Mat jamming equipment planted around the galaxy by the Ludoids and so automately defeat the Ludoid menace! this is a fairly original variation on the old quest plot and the game features several original humourous touches such as the Rambo of the micro world Rambot! This depressive killer robot is out to get you and provides an extra hazard in your wanderings around the galaxy in search of the jammers.

The game is a Quadraplex Adventure - which is Bug Byte's way of saying it's split into four parts. The first part is set in the CapShift space bar (!) with the following three on the planets of Glacia (pretty cold) Vacatia (nice and relaxing) and Aqua (lifejacket required). There is plenty of tongue in cheek humour throughout the game which certainly helps to brighten it up.

As to the graphics - well they are slightly animated. For instance after ordering from the food machine a tray complete with munchies appears to drift from the machine. The graphics are full screen illustrations most of them very good which scroll off the screen to allow the text to take over and the majority of locations feature an illustration.

At the end of each of the games four sections you find coded co ord nates left by friendly agents which give you access to the next section. The friendly agents though are not friendly enough to give you a hand in completing your task to overcome the Ludoids!

All in all a very enjoyable and entertaining game with nice touches. I look forward to the Ludoids return in the not too distant future.

The Quest For The Holy Grail
Mastertronic
£1.99

This game I seem to remember, was released quite a while ago by Dream Software. It now appears under the Mastertronic banner as part of their assault on the budget software market. Mastertronic have produced several adventures at a budget price... but none of them have been particularly original or imaginative.

The Quest For The Holy Grail claims to be Monty Python with chips! Unfortunately, the game doesn't live up to this tag. It attempts to emulate the Python teams humour but I can't help feeling that John Cleese and co would be embarrassed to be associated with this game. While it is a passable adventure the Monty Python connection is very loose. Something I would like to see would be an OFFICIAL Monty Python game — that could be interesting!

Back to the game in hand. Your aim is to guide bold Sir Tap pen through the medieval terrors in search of the legendary Holy Grail. The landscape is filled by several weird characters who do strange things. There is the three headed knight who has a lot on his shoulders and others with odd names such as NC, LC and SC. To be avoided at all costs is the rampant killer white rabbit who literally has an explosive personality. All this is mildly amusing but never 'zany' as claimed on the cassette inlay. The text part of the adventure is quite enjoyable humorous in places but nothing remarkable.

The real problem with this game is it's graphics. These really show the game's age being square chunky block graphics with the occasional sparse line drawing. The graphics are really disappointing. Compared to these the graphics of Never Ending Story are positive masterpieces.

This game could have been so much more but unfortunately at no point does the game live up to the inlays promise that it is the computer game to surpass all others. It most definitely is not. It's more a very average game with touches of humour and outdated graphics.

Brian Robb

Tortoise Wise

More thoughts from a parent who gets left behind.

Yes of course I've left like Turning Turtle more than just a few times. But — a gentle reminder to the kind reader who wrote to TURTLEWISE — it's TORTOISE Sir, and proud of it to boot.

The competition still seems formidable as I look over the shoulders of the younger generation hunched over their keyboards during their non sleeping, non eating hours.

I used to ask innocently:

Can you explain what you are trying to do in this program son? But that is rather like sticking your head under the guillotine these days. The temptation to lop great chunks from my already fragile dignity is too great for them.

I stay on watch. On the defence. Learning their little ploys to weaken my morale. My mantra is Tortoisewise is Slowly but surely.

Dad says the eldest son earnestly, while I relax in front of the box watching a favourite programme (spelt with ME at the end of the word).

Dad, I'm getting a RETURN without GOSUB error report. Shall I check to see if a GOTO has been entered instead of a GOSUB in the program?

Stay calm. I think to myself. This is not a genuine enquiry. It's meant to make me look stupid. Don't take your eyes off the screen, answer calmly and confidently — Surely you know the answer to that one by now don't you? To which the reply is something along the lines of: Of yes. Of course I know. I was just checking to see if YOU knew. And then there is a haughty laugh.

But you get used to that laugh. As parents we get used to that laugh. It is the same laugh that greets your gyrations on the dance floor at Christmas parties with the family. The same laugh that greets your flares every time you were them or your records when you play them: the grey hairs, the middle age spread — we've met it before.

Try a retort like: They laughed at Marconi you know or they laughed at Copernicus. That usually stalls them for a while and gives you a chance to show off a bit of non micro based knowledge. So do not despair. Indeed a word of comfort to the reader who wrote that the only Machine Code she is ever likely to learn is found on the labels of washing that piles up around the house. My sons may be familiar with a programmable Interface. But it will be years before they are familiar with our programmable washing machine.

It is a waiting game.

A year ago the eldest son confidently stated his conviction that in his life girls could never take the place of computers. He lavished his time and money on his Spectrum and may even have kissed it goodnight for all I know. What I do know is that since then puberty has smacked him between his eyeballs and some days he's all over the place. Do I buy a new game or a new record? Do I spot the bugs in a program or try not to be bugged by the spots on my nose? Do I sit at the keyboard and turn on the Spectrum or do I sit at a friend's house and get turned on by his eldest sister?

We parents have lived with this state of affairs for years. It is called CONFUSION and there is nothing quite like it for closing the gap. Tortoisewise.

I can't wait until he falls in love. That's when I'll quietly nip out and buy that QL and printer.

David Stewart

We, the jury . . .

Gladiator
Domark
£8.95

Gladiator shows life at the sharp end of the Roman empire as you hone your combat skills to avoid death in the arena and work your way up to become the Emperor's champion.

Before going into the arena for real you can watch two practiced gladiators hacking away at each other and make a wager on the outcome. To prepare yourself it is advisable to experiment with the various movements and weapons at your disposal on a stationary opponent in a two player mode. This however can be more difficult than you imagine as if you get too close you may walk onto the sword of your inert adversary.

When you have lunged, jabbed, parried and thrust to an acceptable standard you are ready for the contest to begin. An important element is choosing your weapons — an armoury of daggers, swords, lances, nets and tridents can be used or if you feel defensive there is a choice of shields. In all there are 45 options from which you can select three. You won't see what fiendish weapons your computer champion has opted for until you are face to face.

The controls are complex and take time to master either on the keyboard or with joystick, there are 25 separate movements and many require a double burst on the joystick. While you are still improving your gladiator skills you will have to get used to playing pin-cushion for your opponent. There are three bouts in each game and your defeat or victory is confirmed by looking to the Emperor — the figure transforms into a huge hand to give the thumbs up or thumbs down signal.

If single combat games appeal to you, Gladiator should provide you with many hours of swashbuckling pleasure and if you want a duelling game with that extra element of difficulty then definitely take a stab at this one.

Defeated Gladiator heading for the thumbs down

Sweevo's World Gargoyle Games £7.95

This is the first computer game that's actually made me laugh out loud! Unlike Gargoyle's earlier games that have been quite serious and mentally taxing, Sweevo's World is an enjoyable tongue in cheek romp through the sort of territory originally explored by Ultimate in Knight Lore and Alien 8.

Sweevo is a Self Willed Extreme Environment Vocational Organism designed to go out into the galaxy and clean up inhospitable planets. The trouble is that as Self Willed Extreme Environment Organisms go, poor Sweevo is a bit of a failure – he's failed all the tests that the Sweevo machines are meant to undergo (he failed to turn up for the memory test as he forgot all about it) but his Robo Master has decided to give him one more chance to redeem himself.

The artificial planetoid Knutz Folly created by one mad Baron Knutz and his wife Hazel is populated by all sorts of genetic experiments created by the Baron and it is Sweevo's task to boldly go where no Sweevo has gone before and clean out the place.

Graphically speaking Knutz Folly bears a strong resemblance to the Starship in Alien 8. The view is the same sort of overhead perspective as in the Ultimate games and Sweevo who is an ungainly but endearing looking character moves diagonally across the screen as he moves around the rooms. Keyboard control of Sweevo is actually better than the control system used by Ultimate, though. Instead of rotating and moving in the direction that he's facing Sweevo simply moves in one of four directions by using the appropriate keys and I found this system much easier to use than that of Alien 8/Knightlore.

The rooms of Knutz Folly contain the sort of obstacles, block and traps that have become familiar to games players, but instead of being able to jump over these obstacles Sweevo must locate elevator pads in the rooms which will lift him up. But it's not always obvious how he can use these pads to get around obstacles and Sweevo has to collect objects such as tins and boots which will come in handy.

Some of the traps that are in here way are very novel. There are great fingers that come thrusting up out of the ground, Incan statues that do the same and pixie like creatures that look cute but are absolutely deadly. All these things are large and finely detailed and very well animated – especially the fingers that have a sort of surreal quality (well when was the last time that you saw a six foot finger pop up out of nowhere?).

All the screens are drawn in just two colours, in order to avoid attribute clashes, but the overall quality of the graphics is excellent.

The outstanding feature of Sweevo's World though is the warped sense of humour it displays. Some of the deadliest objects in the game are bits of fruit and the way to recharge Sweevo's energy level is to goose a goose (you see there's this goose running around the one that lays the Golden Eggs and if you run up behind it and go Boo!' then it will recharge your batteries). Oh and if you walk into a room that has a hole in the floor then drop though that hole at your peril!

There's much more in Sweevo's World that I could go on about, but the best thing I can say about the game is that I'd rather go back and carry on playing it than sit here and waffle on much longer.

Spellbound Mastertronic £2.99

This is a real budget gem from Mastertronic's new M A D range (Mastertronic's Added Dimension). Titles on this label will be £1 dearer than the rest of their games but if Spellbound is an example of the standards that these games will set, then they're going to be worth every penny.

Spellbound is the followup to Finders Keepers, but is a larger and more sophisticated game which combines arcade action with an adventure style command system.

You play the part of The Magic Knight who has to rescue Gimbel the Wizard and a number of other characters from a castle where they have all been trapped after one of Gimbel's spells went wrong. The Knight is a large, finely detailed sprite who is smoothly animated as he wanders around the rooms of the castle. In his wanderings the Knight will come across the characters he is looking for as well as a variety of objects that can be used to solve the problems that will bar his way. In solving these problems you are able to use an ingenious system of pull down menus to assemble some quite sophisticated commands just as if you were manipulating objects in an adventure. For instance, if you are carrying some objects and you want to use one in some way by pressing fire you call down the first menu. This presents you with commands such as Get, Drop, Examine, Blow, Cast Spell and so on. Then by going to the next menu you can specify which object or character that command is to be used on.

All the characters and objects in the game have their own status tables with details of weight, magical energy, state of mind and other qualities that will allow you to use them during the game. This adds another element of puzzle solving to the game as you have to work out the best way to use all the objects and to keep all the characters safe and happy. And if that's not enough, there's a time limit and some of the usual arcade style obstacles and traps to get past as well.

All in all, Spellbound is a game that would be good value even if a few more pounds were added to the price. Mastertronics and the game's author David Jones have done very well to produce such an excellent game at such a low price.

Tau Ceti
CRL
£9.95

Many attempts have been made to combine fast arcade action with complex adventure type quests but none more successfully than this one from CRL.

With a well set sci fi scenario and a seemingly simple task to shut down the Fusion reactor in the capital city of Centralis on Tau Ceti you are set down in one of the cities at the controls of a skimmer. This machine literally bristles with equipment and armaments a laser eight heat seeking missiles anti missile missiles flares scanners compass shields night stands and a computer (guaranteed debugged!).

The first plays are used simply getting to know how to use all this equipment and then you have the joy of using adventure style commands to communicate with your camcorder recognising the various buildings artifacts and enemy craft and using the map (very impressive) and teleport system to get around.

The arcade sequences alone would have made a good game but the additional strategy and thought required puts this game in the same league as Elite.

I know these games don't appeal to everyone but for those who like a real challenge in the best of computer gaming this is a must.

This is surely a first for ZXC another rare six star program.

Swords And Sorcery
PSS
£9.95

This is not really an arcade game and unlike Tau Ceti which is arcade with an adventure plot this is strategy with graphics.

I have a friend who bought a Spectrum a year ago because he hoped to play Dungeons and Dragons on it although several brave attempts have been made nothing actually satisfied him and eventually he sold it. This program will make him sick that he didn't wait!

PSS have been promising this program for over a year now surely the longest wait for a program so far, and we have been gently reminding them at every opportunity. So now it's here... what's it like?

Quite simply it is the best version of Dungeons and Dragons ever produced on a computer. Using only six keys three for movement and three to access menus a wide range of actions can be executed. Two large windows are used the main one at the top centre of the screen is a plan view of the maze showing your position and any monsters in the vicinity. Your character walks around this maze and when you are engaged in battle it becomes your status screen displaying both the monsters and your own status details.

On the right of the TV screen is a 3D perspective view of what you are facing this also alters as you move. At the bottom of the screen a window displays actions and conversations which you are engaged in. Finally there is a menu of options which are selected by scrolling them until the one you want is at the far left and then pressing key 9. Initial characters can either be the built in default one (Flubbit the Dull) you can load a previously saved character from tape or manipulate a new character and train him/her.

A little practice is required but once mastered using the keys gives fast access to the options which is just as well as the game needs fast decisions. I really enjoyed it and had some fascinating and humorous conversations with some rather strange beings. All is forgiven PSS swords and sorcery is well worth the wait.

Beach Head II
US. Gold
£7.95

A shoot 'em up war game from US Gold which I enjoyed more than the original. There are plenty of options — one or two players, three difficulty levels, choice of being attacker or defender and keyboard or joystick options.

The game consists of four phases: attack, rescue, escape and battle. Beach Head II bears some vague resemblance to the arcade game Commando, although the graphics are nowhere near as good.

The graphics are excellent, though small, and they are well animated. Scores tend to be of the massive variety and these are kept on a high score table. Sound is to the Spectrum's usual standard. The machine plays a mean game in the one player mode and should provide a challenge for the most ardent arcadian. I particularly liked the two player mode where you can get rid of your aggression by slaughtering a friend.

There are some who believe that this kind of wanton destruction is morally unhealthy — I suggest they avoid this program. Personally I found this to be a good example of the mindless zap everything that moves game and I must also admit to enjoying a few plays when the strain of coping with the state of this art mindbenders becomes too much.

Gyroscope
Melbourne House
£7.95

I remember owning one of these devices: you spun the wheel inside the frame and as long as it whirled fast enough or didn't hit anything it would balance upright on virtually anything: a piece of string, a pencil point or follow a ramp of books.

Why I mention this is because Melbourne House has created a program in which the movement of their gyroscope is incredibly accurate when compared to the real thing!

With some similarities to Marble Madness, now a hit in the arcades, you have to steer this awkward object down five maze-like ramps, each extending over four screens, these are beautifully created in solid 3D perspective and have walls and pits to crash into. As if that's not hard enough there are steep slopes, slippery glass patches, directional magnets, aliens and narrow ledges to contend with. Oh and you are racing against the clock, but at least you get seven lives with extra ones for every 1000 points.

I played this game for far longer than I could really spare for the review and found gentle nudging of the joystick (or keys) game me the most control. Another tip — don't let the gyroscope build up too much speed. I completed the first screen after a few plays but only completed the second screen once and after many attempts a tearing of the hair program.

A mention here of the sound. I am sure they must have used their WHAM program because it is without doubt one of the most impressive bits of music I have heard so far.

Brilliant. One of the state of the art programs awarded our rare six star award.

I, Of The Mask
Electric Dreams
£9.99

From Ex Qu cks lva programmer Sandy White he of *Ant Attack* and *Zombie Zombie* comes a graphically stunning frenetic 3D perspective maze game. Your enemy is time and the only way to get anywhere at all is by quick thinking.

The instructions are vague but your task is to search the maze and collect the parts of the robot in the correct order, before your energy is exhausted. It is impossible to simply run around the maze and you have to make frequent and strategic use of the crystals found at each junction. Firing at one will transport you to another junction another will transport you to a different passage of the maze and the third will reveal a piece of the robot which has to be hit three times on different faces to be collected.

The robot pieces are not identified and you have to learn by experience which is which. Shooting a piece out of order loses one of your three lives.

Your energy runs out at an alarming rate and only by shooting a robot piece can it be replenished. I often had to sacrifice a life in order to keep up the energy. Running out of energy ends the game.

I tried mapping the maze (a full map is available on screen) but the transporting system is not shown.

One for those who enjoy fast thinking frustrating games.

Potty Professor
5oftware Farm
£6.95

Software Farm a leader in ZX81 games turn their hand to the Spectrum market and as could be expected from a company who established and pioneered Hi resolution graphics on a machine never designed for them it is different.

The programmer must be a fan of Heath Robinson. For those who don't know Robinson was the inventor of the trivia machine: a whole room of complicated machinery linked together to perform some simple act such as lighting a match and this is the aim of the game. You are presented with a task (the first is to flush the toilet) and a graphic representation of a set of objects. These may be selected and positioned in various places to create a machine to perform the desired task.

Not all of the objects may be required, and some may be needed more than once. The actual task can only be successfully performed when you duplicate the machine that the programmer intended you to use. My moan is that I created several devices which I'm sure would have worked only to see them collapse when set in operation. Another quibble is the accuracy that is needed in positioning the objects there appears to be very little room for error.

This is an unusual program which will appeal to the lateral thinkers among you and to those of you who enjoy tinkering around with mechanical things. You'll need a lot of patience though.

BC's Quest For Tires
Software Projects
£7.95

Direct from comic strip to screen comes Thor of BC. Frantically pedalling his unicycle he faces a formidable task: first he must jump rocks and holes, then duck and jump until he reaches the river.

To cross the river he has to leap on the backs of turtles and then hitch a lift on the Dooky Bird. Once he has achieved this he is beset by falling volcanic debris as well as obstacles on the ground until he reaches the cave where Fat Broad and stalactites wait to hinder his final objective of rescuing Cute Chick.

Actions are fairly simple: speed up, slow down, move forward or back, jump and duck. Keyboard use is well thought out, WQMK plus ENTER and the usual joystick options are included. Using a joystick does make life easier with this game.

Graphically this is well designed: the characters are carefully drawn, excellently animated and the backgrounds are attractive. Inevitably there's a little colour clashing due to the limitations of the attribute file and the range of colours used, though personally I did not find this off putting.

For what amounts to a fairly unsophisticated game I found that I had spent an unusually long time testing it and I have gone back to it a few times since. Every time I misjudge an action I kick myself and try again because I KNOW I can do better — is this the definition of addiction?

One Man and his Droid
Mastertronic
£1.99

This is yet another program from Mastertronic which proves that cheap does not always equal nasty.

There have been one or two sheepdog type programs before but in general they were pretty dire. This game has got it right and provides all the irritation and frustration of dealing with the mindless wool machines that I remember from my days on the farm. Actualy the game does not have a rural setting but as the title implies is set in the future on the planet Andromadous.

The task is very much in the sheepdog vein as your droid has to round up the six Ramboids in twenty caverns within a time limit and take them in correct order to be transported back to Earth.

Each cavern consists of a maze of tunnels which your droid can fly around, dig himself down to allow Ramboids to pass over him or tunnel through walls. Each operating mode is selected by pressing the fire button and by holding the fire button down you will be shown the location of each remaining Ramboid.

Before you can actually begin to round up the flock you have to get from the bottom of the screen to the top past hundreds of wild Ramboids who obstruct your path: this seemingly simple task can be annoyingly frustrating. A nice touch is that at the start of each game you can enter a password which will allow you to begin on the screen you last achieved access to.

An action-packed mind boggler at a great price.

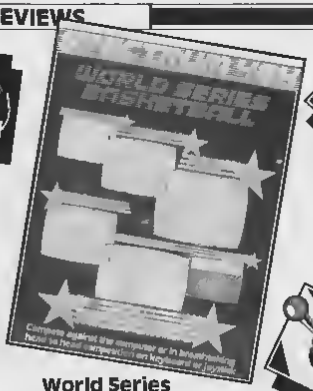
OVERALL	★★★★



World Series Basketball
Imagine
£7.95

This company seems to be specialising in sports simulations at the moment and seems to prove that specialisation is no bad thing. I used to enjoy playing the old arcade game of Basketball with the roller ball and two players but this game relegates it to the realms of antiquity.

You can either play against another opponent or against the computer and control a team of four players. The action is fast and you need plenty of practice to win especially against the computer, even at the lowest of the six skill levels. Luckily a practice mode is provided.

To do well in this game it is not enough to just run with the ball and shoot for the basket you need to develop the technique of passing to your other players. Control of the players is cleverly done in that the member of your team nearest or actually with the ball is highlighted and under your control. Pressing fire causes him to jump, holding fire causes each player in the team to jump in turn, so when the player you want to control jumps you release the fire button and control has passed to him.

While the player(s) under control move the computer takes charge of the remainder of the team and tries to move them in an appropriate manner, usually this is very effective although I have seen players immitating headless chickens on occasion.

A challeng ng fast and fairly realistic game.

Grumpy Gumphrey Supersleuth
Gremlin Graphics
£7.95

The copy we received was a pre-production copy and had no instructions whatsoever so if I get something slightly wrong I claim ignorance!

You appear to be a store detective who is striving to keep his job. Messages appear at the bottom of the screen and I assume you have to deal with them. These tend to vary from the mundane (the boss wants a cup of coffee) to the bizarre (ducks on the ground floor!).

Wandering around you begin to remember the layout of the store and where various objects can be found. The series or sequence of actions to achieve your objectives is one which you must discover for yourselves. I must admit I have not been able to get very far at all (and I've tried how I've tried!).

The animation is superb and of the large animated cartoon variety, the other characters are carefully created and all the action takes place in a well designed, frustratingly complex building. If this kind of visual arcade puzzle is your cup of tea then this game is for you, but personally I find it irritating.

I think there is probably more to this program than I have discovered and so I will simply say that if you liked *Everyone's a Wally* you'll probably enjoy this one. If you are easily frustrated then try it out at your local shop first.

Discovering Discovery

Hints and tips for the Opus disc drive, from John Wase.

The Discovery unit with a second 5.25" disc unit attached together with my faithful Spectrum and FX-80. Note the extender ribbon cable as recommended by Ray Elder

The Discovery disc system has had several reviews in the months since its release, ranging from thorough articles to the glib and superficial. It is hard to blame the reviewers for they often only have the item for a few frantic days. However, I've had mine for several months, so perhaps I can add a few hints for potential disc buyers.

Paging the ROM

For those who *haven't* read the reviews, I'll give a quick explanation of the Discovery's working. Discovery ROM intercepts Spectrum error messages. If the statement contains a disc command, then the Spectrum ROM is paged out and temporarily replaced by Discovery's ROM. Sinclair himself employed a similar method with his ROM controlled microdrives. In the present case it controls discs. Whilst this presents one or two small problems, it also has compelling advantages.

Because Discovery apes Interface 1, it is not compatible with microdrives (although not working is possible via the on-board parallel interface). However, it will accept all BASIC microdrive commands; moreover, these are extended, for instance, *m* channel is default. This makes syntax immediately familiar. Additionally, there is the overriding advantage of direct access to streams and channels.

Reliability and expansion

My experiences with the 3.5" single-sided drive Discovery unit have been good. Sceptics might be interested to know that I have as yet had no errors with 3.5" discs — they're incredibly reliable. Their formatted capacity of 178K (about twice that of a microdrive) is, however, still quite low, so I added the RAM chip and a second drive, but mine is a double sided, double density, self powered 5.25" unit of formatted capacity 718K. I've invalidated my guarantee, but enormously increased capacity (5.25" is still very much a standard — a pity Opus don't market a 5.25" unit since their system obviously runs it).

Although the software is already built in to detect disc size and density, my modification has two disadvantages. Firstly, the two units must be connected to a common mains source. If the switch on the back of Discovery is used, the two discs get out of phase and the system crashes. Secondly, in the original Discovery 2 system, **MOVE d: 1 TO d: 2** copies the complete disc from one 3.5" drive to another, however, when I try this, the system detects two different disc sizes, giving the error report "wrong disc" (this is not in the hand book, but it's there).

Obscure errors

This brings me to the system itself — a most workmanlike piece of code. So far I've found no bugs and enquiries have revealed only one (extremely obscure). The error trapping is a case in point — I've already mentioned one undocumented error report. If you disassemble the ROM, you'll find another — try opening a stream to a stream (the mind boggles, but it's possible), then try printing it (e.g. **OPEN #5, #5: PRINT #5** — those without Discovery can get the error message by sending me an s.a.e.!). The ROM is therefore in many ways different from Sinclair's Interface 1 ROM, and the hook codes are different. I am fortunate enough to have acquired a complete table giving more than sufficient information for the average machine coder; please write to me for a copy.

Tape to disc

BASIC software is very easy to modify. Tasword II's microdrive version goes straight on. Evesham Micro Centre's Interface III transfers even machine code: transfer to tape and use a header-reader (which they'll supply) up above RAMTOP to give start and length of the three CODE sections, then alter the BASIC loader accordingly.

Peripheral power

Discovery is very reliable. The on-board power supply has attracted unfavourable comment but in fact has ample spare capacity for any number of add-ons. It is not the quickest disc (but we're talking seconds, not minutes!); for instance the new Kempston is quicker. However, its real power lies in its combination of direct access to streams and channels and its random access facilities: no other system has quite this combination.

Files are OPENed using the 'M' channel just as with microdrives, and are similarly MOVEd to screen or printer through the on-board parallel interface to check contents, to get Tasword II to print, all you do is insert OPEN #3, "b" at the start of line 15.

As extensions to microdrive syntax, files are specified as IN or OUT with EXP you can expand a file, and with POINT you can read randomly any item. This is extremely powerful in sorting data: for instance a dedicated database is currently being written which will store a dedicated database is currently being written which will store scientific references, recoverable at random on the basis of authors, keywords or of journal. So what did Fred Bloggs publish on SUPERBASIC in *ZX Computing*? is immediately answerable. The catalogue itself a file, can be printed out or even used as sort data prior to ERASEing automatically unwanted files.

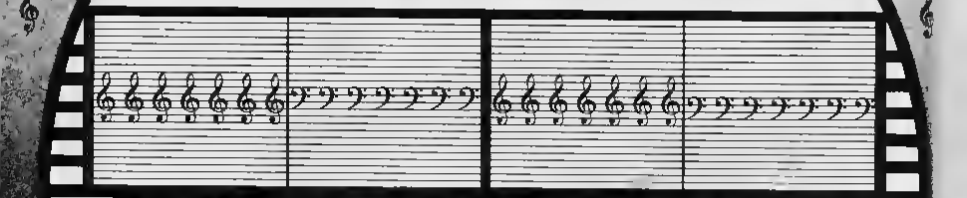
I had thought of using Discovery with some of the Beta Basic routines (for instance it will convert strings to all capitals, simplyfying subsequently sorting). Unfortunately the program thinks there's an Interface 1 ROM there, and some parts (the error messages for a start) get screwed up. I am assured that a Discovery-compatible Beta Basic 3.0 will be on the market by the time this is in print.

Finally, readers might like to know that there is a Discovery user group, based in Holland (for the system has sold well internationally); contact D. C. Kruithof, Boelerkade 6, 2725 CH Zoetermeer, The Netherlands. In short, Discovery is just what one might have expected of Company which already has a reputation for producing add-ons for other micros. I have found it versatile, workmanlike, absolutely reliable and strongly recommend it.

Readers can contact John Wase c/o Department of Chemical Engineering, University of Birmingham.

Micro Music

This month we look at WHAM, no, not the group but Melbourne House's much vaunted program for the Spectrum.



Wham! The Music Box is claimed to be the complete sound system for your Spectrum and as such has a lot to live up to. The Spectrum has long been noted for its particularly pathetic sound facilities and apart from a few exceptions — Romantic Robot's Music Typewriter for instance — programs which are based on this feature are doomed to failure. So what has MH produced to entice us?

The answer is a novel and adventurous way of producing (to all intents and purposes) TWO channel sound without any add on units. No, I couldn't believe it either and loaded in the program with a large dose of scepticism.

The program is supplied with five demonstration songs built in all by Wham (the group) and very impressive they sound too — well technically speaking anyway.

Volume is not very loud at the best of times and sound quality on the Spectrum has always been rather dubious but it is true there is very definitely two channel sound and also, by very clever timing, a rhythmic percussion effect as well.

Even played on an unadorned Spectrum it's way ahead of anything else but add a sound boost such as Cheetah's or the Currah Microspeech or the SSL units which output the sound through the TV speaker — or even the DK Tronics amp and you have a very respectable music machine.

On Test

At first I was concerned with the fact that the instructions only took up six sides of a cassette in lay. I like my instructions to be at idiot level and explained step by step in fact they are a lesson in brevity and precision. They do use a step by step approach and very quickly and clearly introduce you to using the program.

There is no attempt to teach any music at all, the user is assumed to have a background knowledge or to be willing to experiment. The problem with experimenting is that you get things *wrong* and need to be continually changing them. The editing facilities of some other programs have been a serious problem but with WHAM you can delete back by one note at a time or overwrite selectively. This makes editing quick and simple.

When the program is first loaded you are faced with the main options menu consisting of:

1 Load a tune
2 Save a tune
3 Hear the tune
4 Whampile the tune
5 Set tempo
6 Edit mode
7 Help page

All these except (4) are straightforward and I'll go into this one later.

From each of these options you are taken to a screen with its own set of controls and options. These are on the whole well prompted and easy to use and a constant display of status is provided. Music is entered by using the keys CAPS SHIFT to SPACE as a piano keyboard and each press produces a semi quaver on the staves. You have a range of four octaves which you select by pressing keys 1 to 4.

Notes longer than a semi quaver are supposedly produced by repeating as many semi-quavers as are required to make up the note. These are played as separate notes to play a quick staccatto semi quaver trill. To get around this you have to be quite ingenious with the use of rests and tempo techniques.

Other keys which have functions are: (6) to return to the main menu, (7) to erase the whole tune, (9) rewind, (0) step back one note, (Q) replay tune, (W) set repeat marker, (E) bass drum effect, (R) restart, (T) toggle between channels 1 and 2, (O) fast forward, (P) play single note.

Percussion

Drum effects are possible from a simple synthesizer type section. Pressing E places a standard bass drum effect in the music and pressing B puts you into 'noise' creation.

Once in this option you have the choice of selecting between seven different waveforms and four durations these are positioned in the music by the Y, U or I keys.

You have to be very clever indeed to use these options effectively as the Bass drum takes out one note from one channel and the noise takes up a note from both channels. As you can imagine this can be very effective but you have to be extremely ingenious to use it to its full.

Whampile

This is one of the main reasons why some people will purchase this program. By using this option you can compile a tune in memory and save it to tape.

This saved version can be reloaded and run independently to WHAM and can be incorporated into your own programs to play either note by note as the program operates or as a one off introduction piece.

This does for sound what the graphics utilities did for title screens or HURG did for DIY games. I am impressed but I must say that as a serious tool for a musician or composer then it is not really of any real use. However as a fun program it is brilliant. I took it to a school and let the pupils there try it and although none had any musical knowledge it fascinated and entertained them for hours. Finally, as a means of getting impressive sounds and music in your own programs it is invaluable. I may be mistaken but I'm sure I heard WHAMPILED music in GYROSCOPE, Melbourne House's latest arcade game.

Machine Code Trace

Coventry's Carol Brooksbank wrote this utility to find bugs in her programs and she thought she'd share it with us.

I don't know about you but I don't think that I have ever written a machine code program which ran perfectly first time. You know the feeling. Eagerly you type in your latest masterpiece, enter RANDOMIZE USR something or other and **CRASH!** There you sit with a frozen keyboard and only a blank screen or a pretty psychedelic pattern to look at. You have no idea whether there is a fault in the logic of your program, whether you have made a typing mistake or miscounted a displacement and you don't know where to start looking for the trouble, because you do not know how far into the program the crash occurred. Well help is at hand.

This machine code program will give you a hex trace at the right of the screen as your program runs. It's only a partial trace as it does not show the address of every instruction as it is executed — if it did the display would change so fast that you would never be able to read it — but every 1/50 second it gives you the address that the program has reached. This is enough to let you keep an eye on the progress of your program and to see where things start to go wrong. For instance, if the crash is caused by the program getting into an endless loop you will see the same sequence of bytes repeated over and over again after the crash happens. If you left out a return instruction so that the program starts running through the empty bytes above your program that too will be obvious. But remember that the trouble is not always at the point where the crash happens. A wrong displacement instruction may be some way away from the point to which it directs the program. You will still have to think for yourself to decide why the program runs as it does.

Why is the display in hex? Two reasons. The first is purely personal. I wrote the program for myself in the first place and I always work in hex, so a decimal display would not be very helpful. (One of these days I shall find myself asking the greengrocer for "0A pounds of potatoes please".) The second reason is rather more important. There is a direct relationship between the binary form of a number — the bit pattern held in the registers — and the hex form which makes the conversion between the two very straightforward. Converting an address to decimal would involve multiplying the high byte by 256, adding the low byte, then isolating the 5 digits one by one for printing, all of which would make the routine much more complicated. Since the trace routine is in the form of an interrupt subroutine it is desirable that it should be as short and simple as possible.

The routine makes use of the fact that, whenever the Spectrum performs a subroutine the return address is pushed onto the stack. On an interrupt subroutine the return address is the program counter the point reached in the main program. If we can retrieve this address from the stack and display it we have a trace. Obviously there are a lot of instructions performed in between the interrupts which are not displayed but this is usually enough to let you see where a program takes a wrong turning. So if your machine code program crashes load in this routine with your own program — I am assuming that you always take the precaution of taping your programs before running them just in case — enter RANDOMIZE USR 65271 (48K) 32503 (16K) run your program again and all should be revealed.

Details

The program is explained by the notes in the listing, but there are one or two details which need more explanation. The interrupt subroutine starts by saving the present value of HL in the two spare bytes in the system variables area at 5C80. This is necessary because the existing values of registers must always be saved at the start of an interrupt subroutine, and if we push it onto the stack it will cover up the address we are trying to retrieve. The address is then POPped from the stack in HL, PUSHed back again so that it is in its correct place when the return is made from the subroutine, and the other register values can then be saved on the stack. The other spare byte among the system variables, 5C81, is used as an interrupt counter. If this has reached 22d the printing position is set to the top of the screen and the counter reset to 0. Otherwise the routine jumps forward to print the address.

The print subroutine starts with the instruction AND 0F which has the effect of resetting bits 4-7 of the A register, leaving bits 0-3 unchanged, isolating the number we wish to print. PRINT must be called, therefore, with the number to be printed in bits 0-3 of A. If the number to be printed is the "left hand" digit of the two in the A register the instruction RRA is performed 4 times to move it to the "right hand" position, but the print subroutine is called directly when the "right hand" digit it to be printed. When PRINT is called the DE register holds the first byte of the screen position for the digit and at the end of the PRINT subroutine DE is restored to that position.

Since there are only 16 digits which we shall need to print (0-9 and A-F) a table is set up starting at FED7 (7ED7 16K) which holds the start addresses of the bit patterns of those digits in the ROM character table. Doubling the value of the number to print and adding it to the address of our table points to the correct place in the table to retrieve the ROM address for that character. The digit can then be printed. After the 4 digits have been printed the program variable SCRP at FF13 (7F13) is pointed to the next screen row down and the program exits via the normal interrupt subroutine.

The listing is for the 48K machine. 16K folk should change the initial "F" in the addresses to "7" each CALL PRINT instruction should read CD897E and the bytes at 7EBD which point to HL to the start of the table should be 21D77E. At START, the high byte of the interrupt vector address is not required at 7EFF so the four bytes between 7EFD and 7F01 may be changed to NOP if you wish, though if they are left as they are the program will simply ignore them.

Saving

To SAVE the routine on tape

SAVE "m/c trace" CODE 65116, 184 (48K)
SAVE "m/c trace" CODE 32348, 184 (16K)

To START the trace

RANDOMIZE USR 65271 (48K)
RANDOMIZE USR 32503 (16K)

To STOP the trace

RANDOMIZE USR 66292 (48K)
RANDOMIZE USR 32524 (16K)

Finally remember that the trace will not work if the interrupts are disabled. You must change your DI and EI instructions to NOP while using the trace and restore them when you have corrected your problems. ▶

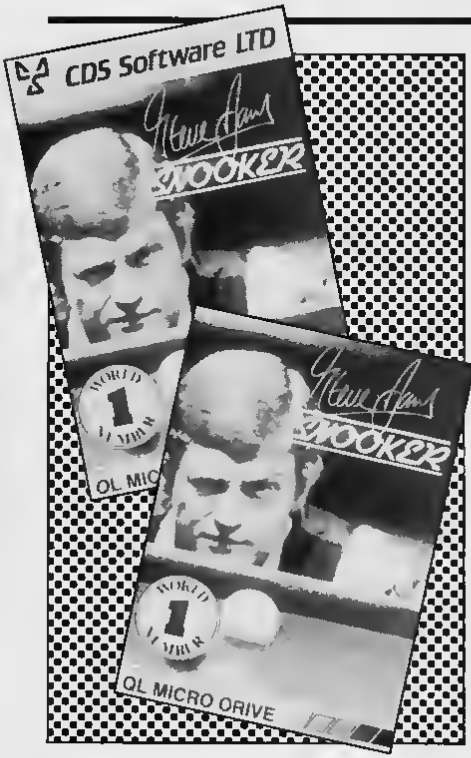
SCREEN DUMP OF MACHINE CODE TRACE DISPLAY

QL Soft

Damian Clay takes a look at more new games for the QL.



Fantasia Adventure
S.B. Software
£8.50

This program is a text adventure set in a series of scenes. The player takes on the role of a spy in a hostile country under the absolute rule of the emperor. Your mission is in two parts: to recapture some of the sacred treasures looted from your country and to assassinate the emperor who is oppressing your people.

There is not much in the way of graphics and both sound and colour are very limited, but then they are not really needed in an adventure program. The text is set out in three windows, two which tell you your location and objects and one for input.

It is very easy to backup as there is a backup program on the cartridge which is run separately from the master cartridge. It is easy to use, all you have to do is place the master in mdv1 and your blank cartridge in mdv2 and run the backup program.

Playing is very simple but it is very easy to get lost unless you keep a map of your movements. Commands are also very simple and can be easily remembered. It is presented very well although there are no onscreen instructions and the written ones are two typed sheets of A4, but they explain the game and how to play it very well.

It is quite a good game overall and is a very good game for adventure lovers, atmosphere is well created and some of the problems are quite difficult.

Steve Davis Snooker
CDS
£14.95

This game is a computer simulation of the game of snooker where you can play either the computer another opponent or the computer can play itself.

The graphics are excellent and they make it look very much like a real table. Use of colour is also very good and compliment the graphics, however black is represented by a green with a pink centre and the brown by a green with a red centre. Sound is fairly well used and sounds quite good.

Making a backup is easy if you know a little about copying from one microdrive to another or disk, because unfortunately there is no backup program on the cartridge which could cause problems.

There is no high score routine as such but there is a high break table which is a fairly good idea. Playing is quite simple with very good onscreen prompts and easy to understand instructions. The only really hard parts are selecting your spin and your power, but when you get used to it it becomes more easy to judge.

Overall it is an excellent game and is worth every penny, well written and is well worth adding to your collection.

OVERALL	* * * * *

QL Blackjack Quest

This game is a computer card game simulation of the English casino version of Blackjack (pontoon), where the object of the game is to get a blackjack or as near to 21 as possible.

You start the game by signing a cheque for £100 which is your money to use to bet on your cards. After you have signed your cheque you start to play.

First you place your bet, then it displays both of your cards face up and the computer's cards one face up and one face down. It is your turn first, and you can HIT (twist), DOUBLE or STICK. If you have two cards of equal value the computer asks if you would like to split. After you have had your turn it is the computer's and it has to try to better your score. Unfortunately the game does not accept five card tricks or allow you to burn on fourteen.

The graphics are very good and the cards look nearly real. Use of colour is also good, and sound, though limited, is fairly realistic.

The game is very well presented although the instructions are a typed sheet of blue A4 paper, but these give you instructions on how to use the game and a very brief introduction to the actual game of blackjack.

Overall it is a very good game and is well worth adding to your collection.

Microdrive File Utility Suite

W.F. Barnard of Oxon helps to get us organised with three useful programs for use with files.

We'd like to know a bit about you for our files said Simon and Garfunkle to Mrs Robinson. She needn't have worried if they were kept on a microdrive as they are bound to get lost or confused.

But now we have this suite of programs to enable microdrive owners to get some order and organisation in their system... three in all and they perform the following tasks:

1) FILE ANALYSER

This program prompts for the name of a file and which microdrive it is on. It then reads through the file displaying information about each line and then the line itself. The information is in the form:

Line number, Line length, Maximum line length so far, and the Total number of bytes in the file so far

The listing can be halted for viewing by pressing any key. It is assumed that the last line of the file is four stars i.e. ★★★★

2) FILE COPIER

With only one microdrive it is not easy to make copies of data files onto other cartridges. This program will make a copy of a microdrive file to another cartridge using only one microdrive. The size of the file is limited by the amount of memory available in the computer.

The program prompts for the filename, the number of lines in the file and the length of the longest line in the file. If any of this information is not known then the file should be first read by my File Analyser. If the last line of the file is not ★★★★ then this is added for future use. A facility is also included to make a copy of this file to cassette. This is sometimes known as archiving.

FILE SORTER

This program allows microdrive files of up to 90K to be sorted into alphabetical order. The size of the file that can be sorted depends on how many microdrives you have. Assuming that a full 90K is available on your cartridges then with one microdrive a file of 30K can be sorted, with two microdrives a file of 45K and with three microdrives a file of 90K.

The program uses two temporary files during my sort and merge algorithm. The last line of the file again should be ★★★★. The program will take some minutes to sort a large file so it tells you roughly what it is doing whilst executing.

The program reads so many lines from the main file into an array and then sorts these into order. It then merges this array with one of the temporary files into the other temporary file. This continues until the end of the main file. The number of lines that are read from the main file and sorted is selected by the user. This value together with the length of the longest line should be as large as the computer's memory allows.

Starfighter

Han Crielard has been stargazing in the Netherlands and invites all budding space pilots to try shooting them!

The object of the game is to shoot at the stars (inverse ★) which grow up. If there are four stars above each other you lose a life. Your task is to prevent such a group of four stars forming. You shoot at the stars and if you hit them they are destroyed but not for long. The game ends when you have run out of lives (you begin with three). If you beat the high score you can enter your name (up to thirteen characters) and at the end of the game the following options are displayed:

Press 1 for instructions
Press 2 to play again

Pressing 1 or 2 will give the appropriate response. You gain an extra life upon reaching 2000 points.

The program is divided into two parts, BASIC and machine code. The machine code prints the score in inverse characters at the top left of the screen and increments it by ten points at a time.

First, type in the machine code loader and RUN it. The computer will display a series of memory address and ask you to INPUT some numbers. These are given in the disassembly listing (figure 1). Then type in the BASIC listing and you are ready to start.

The graphics characters in line 310 are the graphics characters on the A key.

To SAVE the game, type GOTO 9000. The game will SAVE itself and then RUN.

If you find that the score needed to gain an extra life is too high, then alter line 830 as required.

Figure 1 Disassembly listing

Train Race

Train yourself to be better with the times tables. Clyde Bish comes to you inter-city from Exeter.

A great program with wh ch to practise your tables with a cute line in graph cs The techn ques which make this different from the run of the mill multiplication tester programs are that the answer is given so the multiplier is needed and the time limit for the player is obtained from a test at the start

Coupled with Clyde s tight programming techniques and use of the Horizon Big Print routine all in all a program from which everyone could learn

The scenario is a race bet ween two trains to the end of the track A correct response moves the player s tra n (w th appropr ate graphic and sound effects) An incorrect one moves the computer's tra n It also incorporates a routine for testing the speed at which the child can find the key in question and allows for this in the reac t on time thus not penalising the child who is unfamiliar with the keyboard (There must be a few of them still around!)

On LOADing the title TRAIN RACE appears in large letters courtesy of Sir Uncle s Horizons tape) and a train chugs and steams across the screen The friendly computer then introduces itself asks the player s name and explains the idea of the game giving a demonstration of what to do

After checking the time it takes for the child to locate and press specified keys (this infor mation being used later to deter mine the delay time dur ng the game) a choice of maximum multipliers from 2 to 9 is offered The game is now ready to beg n

The computer displays a sum with the multiplier missing and nv tes the child to press a number key If the choice is cor rect the child s tra n toots and chugs on one space If the response is incorrect the com puter s train moves on The game continues unt l one of the trains reaches the buffers If it is the child s train that wins, the machine produces a musical border effect

The score is displayed along with an invitation to play again with the same or a new player at the same or a different level

Entering the program

Firstly LOAD in the wall game from your Horizons tape then BREAK and NEW the machine (Don t panic — you only want the machine code and that s safe above RAMTOP) Now type in the listing but note that the capital letters in quota tion marks n lines 3 4 5 100 110 560 (not the word 'WRONG) 600 (not the word CORRECT) 5000 5050 and 5080 (not the word COR RECT are used defined graphics and must be entered n the graphics mode

To SAVE the program use

SAVE trainrace LINE 9999
SAVE mc CODE 32256 300

and verify with

VERIFY ' VERIFY CODE

If you have a printer attached and want a printout of the child s name the level and the score add the line

1008 LPRINT n$ m ' right s wrong t

Figure 1 Line breakdown

Line 3	POKEs Caps Shift followed by the title sequence. During this the graphics are set up so as not to produce a noticable pause in the running of the program
4 5	moves the train across the track
6	asks for the player's name
100 110	train draw subroutine
200 230	train position/colour subroutine
500-720	main program loop. The computer selects the questions, checks the answers, and produces the smoke graphics before calling the subroutines above
1000 1040	end/play again? routine
3000 3100	large letters subroutine
5000 5090	instructions and demonstration
5100 5160	checks speed of key press and sets level of play
9000 9050	sets up user defined graphics
9999	program autoruns to this line. LOADing in the large letters machine code from the Horizons tape before starting

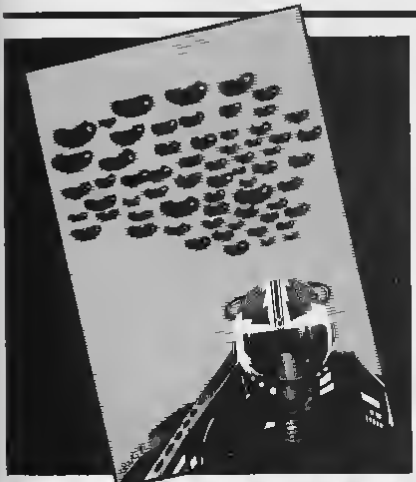
Astro Balloons

A crazy game from D. Mearns of studious Oxon!



Whilst out in your hot air balloon one Sunday afternoon you accidentally drift out of the Earth's atmosphere and through a passing black hole into another solar system. You land on the planet Garthrog where the emperor tells you that to get back through the black hole you will need a good supply of Amthor crystals. However the crystal field is guarded by several asteroid belts. There is only one way through each asteroid belt and even if you succeed you must have ten gold bars to pay the gatekeepers at points along the way. The emperor gives you ten to start off with but after that you must pick up the ten on your way. The emperor then has your balloon refuelled with a special gas which will leave toxic fumes behind. If you double back on yourself you will die instantly.

You may wonder why stars have been used as the asteroids instead of User Defined Graphics. This is because SCREEN$ – which I have used to detect collisions – cannot recognize UDGs. Stars looked the most realistic out of the Sinclair character set.

Another set of instructions is given in the program, along with a choice of sound or not, and the skill level. This ranges from 0 (incredibly tedious) to 9 (impossibly fast). Being a hot air balloon there are no brakes. This means that once you have started going in a certain direction you will keep going (regardless of whether or not you are pressing that key) in that direction until another direction key is pressed. The keys to use are given in the program. Good luck!

Notes

For those of you who are interested, I have provided a brief breakdown of the program, plus a list of the variables used (see figure 1).

Figure 1. Variables and line break down

20 90	Print balloon and check for win. INKEY$ (Stages 1 to 3)
100 410	Move balloon and check for crash. (Stages 1 to 3)
2000 2330	Print random maze for stage 4
2500 2560	Print balloon. INKEY$. (Stage 4)
2600 2910	Move balloon and check for crash. (Stage 4)
3000 3010	Check for win. (Stage 4)
3700 3750	End of stage routine
3800 3820	Crash routine
8000 8080	Print instructions
9000 9070	Initialisation procedures
9100 9220	Print maze. (Stages 1 to 3)
9998 9999	User Defined Graphics

a	reserved for random numbers
d	direction travelling in
f g	reserved for FOR ... NEXT loops
gold	number of gold bars collected
pa	skill level
pause	amount of time to pause in between moves of the balloon
sc	score
screen	stage (1 to 4)
x y	X and Y co-ordinate of balloon

■ After the meteoric return - ■

■ the meteoric rise of ZX Computing! ■

So you want to buy a printer!?

John Wase's jaundiced look at hard-copy machines.

Well, what do you want it for? If you simply want to LIST programs a ZX Printer will probably suffice — it is incredibly cheap (assuming that you can still find one for sale). On the other hand printing text or data after calculations is a much more demanding occupation needing printers whilst take up to A4 paper. So check your piggy bank and then decide upon the paper size you want, decide whether narrow is sufficient, decide whether you need perforated roller paper or cut sheets. (If you want to print out programs the computer can have apoplexy if you try to stop and change the paper — you really need roller or perforated for this purpose). Good, you've decided. Now for the printer.

Daisy, daisy . . .

Daisy wheel printers have a plastic wheel like a daisy about 3" across. Each petal has a letter on it and the relevant letter is struck against a ribbon. Some cheap types have fabric ribbons but the better have cellulose film ribbons and give superb letter quality bank manager stuff. They're not too noisy, but fairly slow (the cheapest only a few characters per second) and you can print only what's on the daisy wheel. subscript and superscript are available on some through software commands which move the carriage up or down, but print is changed only by changing the daisy wheel — tortuous in mid stream.

Double-strike dots

Dot matrix printers are probably the most versatile. They print a series of dots and the greater the density of dots the better the quality of the resultant letters. Various methods of double striking improve still further the letter quality. The best is almost (but not quite) as good as daisy wheel, and usually a lot quicker, though they can be rather noisy. They will often print pictures — useful if you went screen dumps. Their letters are retained in their own ROM (Read Only Memory) where of course they can't be fiddled with, with more expensive ones have a range of typefaces (including italic) and the most expensive ones an additional RAM (Random Access Memory) enabling you to design your own letters or to download other standard typefonts.

Fig 2. Normal and emphasized mode on an Epson FX80 printer

Fig 3. A dot matrix printer with too small a matrix to permit proper descenders

Paper, ribbon and interface

Some dot matrix printers need special paper (can be pricey), some need a ribbon, some will do with either. Some print in a variety of colours by raising or lowering a multicolour ribbon. The cheapest of all the original ZX dot matrix printer (now approaching obsolescence) the Alphacom and the Floyd respond directly to the Spectrum ROM routines and connect up directly to the Spectrum outlet port. All other printers, of

```

As per our telephone conver
outline details of the Journal

The order which we recently ser
+or the University.

If you are interested let me kn
system. I will start work on tr
```

whatever type will require you to buy a separate interface and connecting cable. you must add the cost of this to the cost of your printer

Difficult descenders

The next cheapest dot matrix printers are likely to print on relatively narrow paper then progress up to A4. Some of the cheapest of even the A4 types will still have insufficient dots to give letters with proper descenders. text from such printers can be difficult to read. If this worries you, don't buy.

Do remember that you have by now passed the price of the Spectrum by quite a long way. A good printer can be driven very satisfactorily by an inexpensive computer. Isn't it worth paying just a little more to achieve a reasonable print quality for once you have bought a printer at that sort of price you're stuck with it!

PLOT and DRAW

The third sort of printer is the printer plotter. This usually has a fount of letters which it can print in a variety of sizes by complicated movements of the pen (side to side) and the roller (up and down). They will also respond to commands to PLOT and DRAW, and thus make all sorts of pictures and graphs. As the mechanism wears so the letters get more and more distorted. Some of the cheaper ones require months of work and a long long program to get them to say 'draw graphs'. Don't be overcome by the demonstration picture which it will draw... (one of our post does spent many hours providing software for a cheap plotter to draw graphs from data put into a 8 * * 8 although the thing would draw the most marvellous demonstration graphs on its own). So unless you have too much time on your hands, make sure programming is easy.

If you need to draw overhead projection transparencies or professional graphs for reproduction, do make sure that appropriate pens are available and will fit, and that overhead projector transparencies are firmly gripped and do not slip.

Turning turtle

Finally, there are the turtles which walk along the floor or table with penup and pendown commands. Although they are claimed to produce large posters/drawing/plans they move only on the basis of their own weight and frictional grip and errors are cumulative. I do not believe their accuracy is sufficient for general use as a printer.

Decisions, decisions

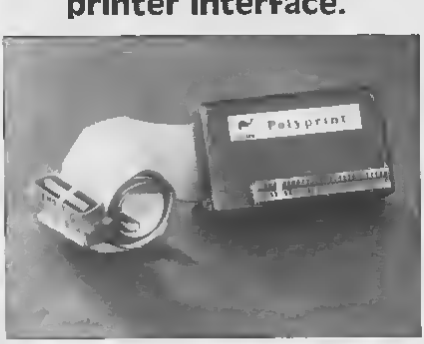
So you've decided which sort. It can be bought from a general multiple, from a specific computer shop, or mail order. Which one?

A few tips might help:

1. See a range of the type you like demonstrated, if at all possible.
2. Ask about the prices of special paper, special pens and replacement ribbons, together with the number of *reasonable* copies from each ribbon. Check the availability of these items.
3. If portable, ask how long the batteries last (on some small portables they'll do only four or five pages before expiring), so you'll either have to have rechargeable batteries and a recharger, or a mains adaptor (extra?) or both.
4. Ask all your friends about reliability. A cheap and nasty dot matrix that jams and loses your text is a curse. If it is being used for instance, to monitor an experiment and print hourly results, you lose the experiment too, for it jams up the computer. Read all the reviews you can — use your local library.
5. Buy by mail order only if you are convinced that the printer is reliable and won't need constant servicing/sending to the makers. Buy cheap ones only from a local shop where you can complain if when they go wrong.
6. Watch the price. Some of the more popular (and very reliable) printers like the Epson range can vary in price by over £100 for the same model, but fortunately can be bought with confidence by mail order. So in these cases, shop around.

Good printing!

Polyprint, the multilingual printer interface.



This is a parallel interface in the usual box with the familiar ribbon cable. The difference is that it contains not just the usual Z80A PIO chip but that it also has an additional 8K EPROM. This is arranged in banks of 1K each of which displaces in turn the 15-16K area of the Spectrum ROM. So what? Well this area contains the character set, and each bank as well as containing the printer driver soft ware (which includes a COPY routine) also contains a character set. On switching on bank 0 is selected, which is the standard Spectrum set. Banks 1, 2, 4, 5, 6 and 7 correspond to French, German, Danish, Swedish, Italian and Spanish.

All very pretty, you may say, but will I ever use this? Perhaps not, but bank 3 besides a Tasword printer driver contains data to change the Tasword character set to those other nationalities too, and this is the real value of the package.

This interface is not the easiest to use. It is not the strongest, nor the cheapest, nor yet the most user friendly, in spite of the very detailed instructions. However, most multilingual users will also want to use a word processor (e.g. Tasword), and here it could be invaluable for, by a few changes to Tasword's BASIC program a variable (e.g. *n*) could be used which would automatically switch the text and also the printer on printing (the examples are for the Epson FX80, but can easily be adapted to other printers). The variable could well be stored along with for example commercial address lists on *Masterfile* and by means of Mailmerge the foreign addresses and envelopes would be correctly printed. All clever stuff if you need a number of foreign languages.

However the real power of this device lies in the ease with which the various 1K banks can be called. Perhaps you don't want all those Spectrum displays, with the exception of the Tasword bank (which contains all the National character sets) — I probably wouldn't! This leaves you with at least six 1K banks to play with. Using an EPROM blower (e.g. Cambridge Microelectronics' PROMER SP or BLOPROM SP), the contents of the EPROM can be read into RAM and SAVEd on tape (for subsequent replacement if necessary). The RAM can then be POKEd as required and the EPROM reblown. You could for instance incorporate foreign character fonts like Arabic or Greek, or mathematical symbols perhaps with the data to enable downloading of the printer. This gives this interface unique advantages (provided that you have accumulated all the other pieces of gear).

If I wanted just to write in German and nothing else, then I would be inclined merely to POKE the relevant new letters into Tasword. This is a specialist piece of equipment and won't appeal to everyone. However to the specialist the combination of all the facilities it offers could prove invaluable.

Polyprint is available mail order from Cambridge Microelectronics, 1 Milton Road, Cambridge, price £44.95 plus [illegible]

Microdrive to Wafadrive

Carol Brooksbank deals with the problems of converting Microdrive programs to work on the Wafadrive.

If you are thinking of buying a Rotronics Wafadrive, you may be wondering whether it is possible to convert the Microdrive options on commercial programs so that they can be used with Wafadrive. It is not only possible, it is easy.

I have recently converted the Campbell Masterfile program with the MF Print option for full size printers, and the examples given in this article are taken from that.

First you must examine the Basic program, and identify all the lines which will need conversion. They are easy to spot, as keywords such as LOAD or SAVE will be followed by an asterisk and inverted commas enclosing a lower case m, for example:

```
LOAD *"m";d;n$
SAVE *"m";d;n$;CODE a,b
LOAD *"m";d;n$;CODE
SAVE *"m";d;n$;DATA f$()
```

In these examples *d* represents the drive number, *n$* the program name, *a* the machine code address, *b* the number of bytes, and *f$* the data array.

In the Masterfile program the drive number is specified by pressing keys 1-8 to select a particular microdrive. In response to the prompt TAPE/MICRODRIVE? Key 0 selects the tape option. You have to decide whether it is necessary for you to select a particular wafadrive in this way. It is very rarely essential to switch from one drive to another in the course of a program, because the software writers cannot be sure that a user will own more than one drive.

I decided to make the program operate on the default drive, drive 1 on power up, because it is easy to go into Basic and designate drive 8 as the default drive if necessary. If you feel you must be able to switch drives without going into Basic, you will have to insert some extra lines of Basic, possibly in the form of a subroutine if there are not enough free lines at the point where you are making the alterations.

```
IF d=1 THEN LET d$="a"
IF d=2 THEN LET d$="b"
LET q$=n$
LET n$=d$+":"+q$
```

The instructions which follow will operate on the specified drive if the Basic listed above is present, but on the default drive without it.

Alter simple LOAD and SAVE instructions which load and save Basic so that they read

```
LOAD *n$
SAVE n$
SAVE *n$;LINE nnnn (auto running programs)
```

Machine code saving instructions should be altered to read

```
SAVE *n$;a,b
```

Machine code loading instructions are exactly like Basic ones, the word CODE is not used in Wafadrive instructions. You must remember though, that you cannot have two programs on the same wafer with the same name, so if the Basic and code program names are the same, alter one or the other. I simply add A, B etc to the machine code name, so that if the Basic program is MF, the machine code is MFA. Also if the code being saved is something such as a file, so that you may wish to save updated versions under the same name, use the form

```
SAVE #n$;a,b
```

This will avoid having to erase the old file, or give the new one another name before being able to save it.

Data

The only area where you meet any difficulty is in the saving and loading of data arrays. There are no Wafadrive equivalents to the Microdrive data instructions.

```
SAVE (or LOAD) *"m";d;n$;DATA f$()
```

Data is normally saved on wafers by using the **OPEN #** and **PRINT #** instructions and read by using the **OPEN #** and **INPUT #** instructions. You could write extra lines of Basic to use this method but it is rather cumbersome and there is a much easier way.

Alter the datas loading lines to

```
MERGE *n$
```

Write the following short program and save it on the wafer you are using for your main program, calling it whatever you like

```
0 LOAD DATA f$0
9999 REM
```

If LINE 9999 is used by the main program replace it with any line number which is unused. f$ must be the array letter used by the program.

Whenever you are using your main program use the save to tape option for saving any files which are in the form of data arrays. It is a wise precaution to make backup copies of wafer files on tape anyway, so you will not be wasting time. Then load in the short program above from wafer, run it, start the tape and the file will be loaded into the Spectrum. Now delete line 10 and save the program on wafer, using the appropriate file name. The file will be saved together with the Basic REM line and you will be able to load it into your main program quite normally when required, because the program will ignore the merged REM line.

To anyone used to loading programs from tape, this method of loading different Basic programs may sound slow and elaborate but remember that programs load very quickly from the wafers. You do not have to search for the programs, the Wafadrive does that for you, so changing programs in mid stream is quick and easy.

You should keep all the Basic, machine code and file programs that you will wish to use together on the same wafer, so that loading them as needed is quick and easy. I wrote a loading program for Masterfile which loads the Kempston interface software, the Masterfile machine code and the Masterfile Basic so that **LOAD *** "mastermerge" gets the whole program running for me.

Interface

Why do I have a Kempston interface when the Wafadrive has Centronics and RS232 interfaces you ask. Well, I already had both a Kempston and a morbid dislike of parting with my hard earned when I bought the Wafadrive so I saw no reason to buy another Centronics connecting lead when the Kempston works perfectly well with it.

What about making backup copies of games onto Wafadrive? I have put Psion Chess onto wafer successfully and it loads much more quickly. You have two problems in this area. First, can you break into the program successfully to make any sort of copy? If so you are halfway there. Whether you can now copy to wafers depends on how much memory is used by the program concerned. The Wafadrive uses part of the Spectrum memory for its own operations and there may not be room for the program and the Wafadrive to operate together. Psion Scrabble is an example. If the Wafadrive is operative when you try to load Scrabble you get the 'report Out of memory' and you cannot initialise the Wafadrive with Scrabble already loaded. If you can enter NEW * when the program is loaded you have no problem, if you can't forget it, remember though that to keep on the right side of the law, any backup copies you make must be entirely for your own use and not supplied to others.

Any other problems? Well the only other one I met was, I am sure peculiar to me. Owing to the curious geography of my small home the printer sits on top of the freezer and whenever the freezer motor cuts in and out it resets the Spectrum. My dealer tells me that something called 'The Plug' would cure this, and I may yet brush the moths off my Access cards and try it, but in the meantime I switch the freezer to fast freeze when I use the Spectrum so that the motor is on permanently, and that cures it. Apart from that no problems. In fact I find the program conversions quite absorbing and the resulting speed when using the Wafadrive a great blessing. I am sure you will too.

Son of Microdriver Strikes Back!

The Mirage Microdriver got some excellent reviews when it was first launched just a few months ago, and now Mirage have produced a Version 2.0 Microdriver that is faster and also offers some new facilities.

In case you missed the reviews of the original version I'll just do a quick recap. The purpose of the Microdriver is to perform tape to microdrive, or even tape to tape transfers of all Spectrum software so that you can now use your microdrive for LOADing commercial software without needing to spend hours of hacking to get past piracy protection systems. However the Microdriver does not encourage piracy, since any back up copies of software will only run if the Microdriver is still connected to the Spectrum. This doesn't make piracy impossible, but since the Microdriver costs almost £40 it does make it financially impractical, so that should keep the industry happy.

The Microdriver looks just like a joystick interface except for a small red button on one side, and an expansion port in the back. It plugs into the rear port on the Interface 1 and once the microdrive is set up with a cartridge in it you can load whatever software you choose from tape. Once the software is loaded you then press the button on the side of the Microdriver, follow the prompts, and let the thing do all the work for you.

The whole process is very easy to follow as the Microdriver doesn't require you to do much more than choose the option you want (SAVE/LOAD etc) and give the program a name. With its Version 2.0 ROM, the new Microdriver is even faster than before, and when I made a back up copy of a game that took five minutes to load from cassette the microdrive version loaded in only eight seconds (thirty seven and a half times faster than tape!).

The new facilities available with Version 2.0 are an improved POKE facility that allows you to enter pokes for infinite lives and so on, an option that allows you to choose whether or not you want to save the current screen display — this can save about 7K of space on the cartridge and further reduces loading times. COPY — this allows you to print a complete screen dump to the ZX Printer (and as far as I can tell to other dedicated printers such as the Alphacom 32 and Seikosha GP50S). There is also a DUMP facility, that allows you to store screen dumps or sections of memory onto microdrive.

If you've got a microdrive and want to use it to speed up loading of software then the Microdriver is an excellent device. It's reliable and very simple to use and though at £39.95 it isn't cheap if you use a lot of cassette based software then its convenience value should justify the expense.

For owners of the existing Version 1.0 Microdriver, Mirage are quite laudably offering an upgrade sevice at a cost of £5.95 when the original Microdriver is returned.

Enquiries, upgrade order etc to: Mirage Microcomputers Ltd, 24 Bank St, Braintree, Essex CM7 7UL (tel: 0376 48321).

Interfaces — face to face.

The problem of hooking up the Spectrum to a suitable printer is investigated by John Wase.

Not so very long ago Matt Nicholson writing for *You and Your Barclaycard* suggested in an article on home computers that there was some difficulty in connecting a Spectrum up to a printer. How times have changed! It's now not only easy, but you're spoilt for choice over the means available. Let's look at the way it's done and some of the alternatives available.

Hardware hassles

There are likely to be four types of Spectrum hardware to consider — the original rubber button Spectrum, the Spectrum+, Interface 1 and add on keyboards, each influencing the way a printer might be connected.

Now, have you chosen your printer? You have? You've chosen it already, have you? By mail order, too? So, you're stuck with it! All right, let's see how to connect it up.

ROM rattlers

If it's a ZX printer, an Alphacom, or a Floyd, then these are designed to use the Spectrum ROM routines LLIST, LPRINT and COPY. They will each fit directly into the Spectrum or Spectrum+ via the rear expansion port, although some might not easily fit every sort of add on keyboard. For other printers, an *interface* and *cable* are required at extra cost — a point worth thinking about if you want only to LIST programs.

Why extra interfaces?

Standard printers expect information to be presented to them in standard fashion, and are designed for this. The information from the ROM PRINT and COPY routines fed out at the rear port is not in a recognised standard form. The ZX printer has a sort of built-in interface which allows it to interpret fluctuating signals as 'make a dot' or 'don't make a dot' (the Alphacom and Floyd can be said to emulate the ZX printer (hence the interface containing the chip) and properly organised (hence the software which will, for instance, permit proper LLISTings of Sinclair Keywords).

There are two main sorts of add on printer interfaces to fit a Spectrum because there are two main ways of sending information to a standard printer. The *parallel* (or *Centronics* type) interface takes each byte and sends each of the eight bits *simultaneously* (i.e. in parallel) to the printer. The *serial* (or *RS232* type) interface sends each of the eight bits *one after the other*.

Printers, in turn are sold set up to decode either serial information or parallel information (or occasionally both) in other words the printer is itself equipped with a serial or with a parallel interface. The majority of printer installations used to be set up for parallel transmission of information, however the swing is now tending towards serial. Nevertheless, many printers still come with a parallel interface as standard; a serial board will cost extra.

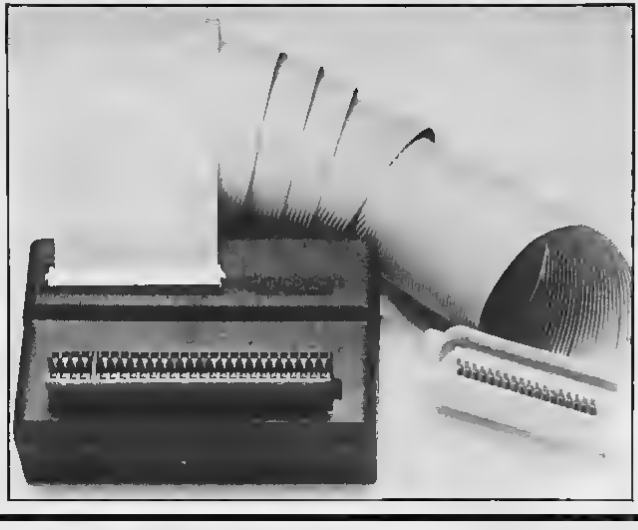
Interface 1

This bad news must be set against the good news that Sinclair's Interface 1 already has an *RS232* port suitable for printers on board. So if you already have Interface 1 you must balance the cost of paying extra for an *RS32* board on the printer and a printer cable against paying for a separate parallel interface to put on the outlet port of the Spectrum. Perhaps this is why there are so few other Spectrum *RS232* interfaces available. Euroelectronics ZXLprint III being the only common one, unusual in that the little box contains both serial and parallel boards and that the relevant cables are sold separately. (And it's the ZX LPRINT III that we use for printing listings and in word processing — Ed.)

Parallel printing

Ah, but you bought the one with the parallel port didn't you! Well, what make of interface are you going to buy, then? The choice is bewildering. At least a dozen, probably more. How does one make a rational decision?

There are two main sorts of



interfaces in one sort the software is LOADed (e.g. from the cassette supplied) whilst the other has software on board on EPROM. Whilst in theory the cassette based software must be fed in each time the printer is used in practice this is not as bad as it looks for instance for writing text Tasword II incorporates modifications for a range of interfaces the POKEs are saved with the program. It is still necessary to LOAD software though for LLIST, LPRINT and COPY (various sizes). This is located in the printer buffer which NEW clears out — a bit of a bind sometimes.

Eprom for efficiency

Interfaces with an on board EPROM are usually a little more expensive but all you have to do is switch on and there it is. It can't be NEWed away but there can still be certain problems. For instance all ZX Basic's keywords are encoded by single ASCII codes or tokens which are decoded by the printer interface software so that programs are LISTed correctly. Sometimes it is necessary to use ASCII codes to send other information to the printer and sometimes this can't easily be done if the software decodes them all the time. In addition certain Basic augmenting programs like Beta Basic and MegaBasic can present LISTing problems. Finally to make big screen copies (A4) you need to feed in additional cassette-based software anyway.

Fitting in

Now the little box itself. First for goodness sake don't just buy one without trying it for size. Some older interfaces will not physically fit the Spectrum+ and some will not fit an add on keyboard so check first next look at the design. Reject any interface which is flimsy or which has an edge connector which is not really good and tight since poor connections can lead to loss of text or at worst loss of computer and interface! There are two main patterns the upright box and the box which lies flat at the back. If you favour one of the latter make sure that it does not need additional support particularly if you use an add-on keyboard. If the interface is hanging out at the back it may not crash the computer though a poor connection at the

edge connector but simply because it may have strained the Spectrum PCB and put a micro crack in one of the conductive tracks.

Is the price right?

Check the reviews check the adverts. This last summer in a seaside chainstore I saw an old model being offered as a special reduction but it was still £10 dearer than the nationally advertised price of a replacement model! Oh do make sure that the instruction leaflet and the cable are included in the little box.

If you are the perfect ignoramus (join the club) take the printer *and Spectrum* to the local micro shop (preferably not chain store). Their prices will probably not be the cheapest but you are likely to get specialist advice ensuring that you are sided satisfactorily. Alternatively for the bargain prices order by mail order.

Cunning combinations

If you are lucky enough to have a rich uncle he might be conned into getting you a combination deal like the Rotronics Wafadrive which comes with both parallel and serial interfaces on board or a Discovery disc unit which incorporates a parallel port. Both these units supply LLIST and LPRINT. Wafadrive comes with Spectral Writer (a word processing program), and incorporates appropriate text printing interface software. With Discovery it's even easier just enter the command **OPEN #3"b"** (for instance) insert this at the start of line 15 in Tasword II and you're away. Oh and do at some stage mention your rich uncle that you will need (at extra cost) a printer cable.

So, what can go wrong?

Firstly *never ever connect or disconnect your Spectrum to the interface of the printer with the power on*. Switch off first. If you pull the Spectrum and interface apart whilst they are powered up you can (and probably will) blow them both. Thus interface wobble is bad news avoid it. A crashing Tasword *can* be caused by dirty or loose connections. Continued crashing from this cause will damage the health of your computer and interface. Power down check that the D plug to the printer is tight and clipped in if clips are provided. Check that it doesn't wobble. Check that the mains plugs are in order that if a mains adapter is used it is satisfactory (without wobble) and that the Spectrum power supply is properly plugged in at both ends. The socket can often be loosened on the Spectrum printed circuit board. Check that the cable interface connection is good.

Some interfaces use a pin connector some (e.g. Discovery) use an edge connector like the Spectrum edge connector. Dirty edge connectors can be cleaned with an ink eraser provided there is still metal there! Make sure that the interface connector is not fouled by the Spectrum heat sink (the aluminium strip) it must go right home. If trouble persists then get your local micro shop to run a test on the gear.

Good luck with your endeavours — and Happy Printing!

Epson Meets The Spectrum

R.G. Luxton thought his troubles were over when he got an FX80 — here he explains the pitfalls.

When I retired my faithful ZX thermal printer in favour of a shining new Epson FX80 dot matrix printer, I fondly imagined that all my troubles would be over, and that I would simply have to press a key or two in order to have lots of different typefaces and other printing tricks at my command.

How wrong I was!

The Epson does supremely well all that is claimed for it and my Kempston E Centronics interface, which has a built in Eprom and occupies no space in RAM, remains permanently attached to the back of the Spectrum, quietly going about its business. What I did not know was that a knowledge of Control and Escape codes was essential to use the many functions of the printer and that some hard study of the FX80's operations manual would be needed.

The Spectrum uses single byte tokens for keywords and the Kempston interface will interpret the tokens to print out the full keywords during LLISTing. This however can confuse the printer so the Epson's control codes must be entered with the keywords OFF. To switch OFF the tokens, **COPY REM CHR$ 0** is entered as a direct command. Similarly **COPY REM CHR$ 1** is entered to switch them on.

I soon found that the Escape and Control codes worked as printed in the manual if I put the codes in Basic lines and set the token switches OFF with a direct command. Thus ESC 50, the Enlarged mode setting requires **LPRINT CHR$ (27), CHR$(14)**, to be sent to the printer in order to print enlarged characters.

Symbol shift

A snag became evident however, when I tried to LLIST program listings containing the '£' and '#' symbols. The FX80 allows you to download any one of nine different character sets for the USA, France, Germany, England, Denmark, Sweden, Italy, Spain and Japan, each of which, in addition to an alphabet, numbers, etc, contains a number of unfamiliar characters applicable to that country's alphabet.

In all of the sets except those for England and Spain, the code 35 symbol is '#'. In the English set, code 35 is the '£' sign. Thus, if you call the English set (No 3) by inputting **LPRINT CHR$(27); R; CHR$(3)**, then the Epson will faithfully print every '£'. But what do you do if you want to print BOTH '£'s AND '#'s within the listing?

(Have you noticed how many magazines print listings for Spectrum programs using an *italic* bracket or the '£' in place of the '#'? Presumably their printer dumps have similar troubles?)

In an ordinary Basic program it would be simple to call backwards and forwards between say, the German set with its code 35('#') and the English set code 35('£'), but this would not do for LLISTing. It was then that I discovered the ESC 6 'Printable Code Area Extension' in the manual, which had obviously been designed for such use. This allows 33 extra characters — Spanish, Japanese etc — to be loaded in to code numbers that are not normally used, thus code 134 is the '£' character. For this you enter **LPRINT CHR$(27); 6;** followed by a call for the character you want printed, thus **LPRINT CHR$ 134** for the '£' sign.

It became obvious then that a program would be needed to set up the printer and do all the switching necessary to call the options required to LLIST with correct printing of the '#' and '£' characters. But if these were contained in just a few lines to MERGE at the end of a program to be LLISTed, then the printer got confused, so that some care would have to be taken switching the tokens ON and OFF.

LLIST

With software-driven printer interfaces, simple Pokes are sufficient to switch tokens on and off, but this does not work with the Kempston E! However, I found that putting the required **COPY REM CHR$ 0** (or 1) into a Basic line works, and the Spectrum even reads the CHR$ instruction AFTER the REM (which it should not do), but that adding a colon and another instruction on the same line will not work!

The simple answer was to put the switching commands on a line of their own as in lines 9995 and 9997 of my program, the **LLIST** and **RETURN** instructions also on separate lines, but I would still like to know why the Spectrum will perform instructions *following* a REM in some cases and not in others!

LLIST, merged on to the end of any program for Llisting and run by a direct command — **GOTO 9995** — works for me and would probably require very little adjustment to make it work equally well for any similar printer interfaced to the Spectrum, even with a different interface.

Extra care should be taken in typing it in as some of the syntax is unusual. The colons are essential and the **CHR$ (27); "E"** in Line 9999 sets the printer for 'emphasized' Pica face, but can be changed as required.

Tasword

This routine will take care of the LLISTing problem, but even the superb TASWORD II word processor program is not without its troubles. On my Epson FX80 the DIP switch pins SW 1 6, SW 1 7 and SW 1 8 have been set ON, OFF and OFF, which automatically downloads the ENGLAND International Character Set with its '£' as character 35, along with other characters specific to that set. This is fine if I want to print the

How Does LLIST work?

```
s=                23755
FN a( )=          (23759) Start of first program line

Line 9986
9987              If next line = start of this routine, then stop
                  Sets up printing format and starts j FOR NEXT
                  loop
9988              If j = # (Code 35), (which would not print
                  thus!) then LLPRINT #
9989              If j = £ (Code 96), (which would not print
                  thus!) then calls ESC 6 'Printable Code Area
                  Extension' and LLPRINT CHR$ 134 ('£')
9990              If j = OPEN # (Code 211), (which would not
                  print thus!) then LLPRINT 'OPEN #'
9991              If j = CLOSE # (Code 212), (which would
                  not print thus!) then LLPRINT 'CLOSE #'
9992              If j = 32, then LLPRINT 't' Below 32's not
                  printable
9993              CHR$ 14 signifies a numerical constant in the
                  line, followed by five bytes for the number
                  itself, so do not LLPRINT them!
9994              Continues with the remainder of the line
9999              Sets variables. The first sets Epson FX80 for
                  'Emphasised' pica face ('E') and can be changed as required

IMPORTANT         OPEN £ in line 9990 and CLOSE £ in line
                  9991 *MUST* be entered using *individual* letters. Spectrum keywords will not work with £
```

the LLIST and RETURN instructions also on separate lines, but I would still like to know why the Spectrum will perform instructions *following* a REM in some cases and not in others!

LLIST, merged on to the end of any program for Llisting and run by a direct command — **GOTO 9995** — works for me and would probably require very little adjustment to make it work equally well for any similar printer interfaced to the Spectrum, even with a different interface.

Extra care should be taken in typing it in as some of the syntax is unusual. The colons are essential and the **CHR$ (27); "E"** in Line 9999 sets the printer for 'emphasized' Pica face, but can be changed as required.

Tasword

This routine will take care of the LLISTing problem, but even the superb TASWORD II word processor program is not without its troubles. On my Epson FX80 the DIP switch pins SW 1 6, SW 1 7 and SW 1 8 have been set ON, OFF and OFF, which automatically downloads the ENGLAND International Character Set with its '£' as character 35, along with other characters specific to that set. This is fine if I want to print the

£' but in this set there is no '#' (which is character 35 in most of the other international character sets)!

A little study of the program printer control codes shows that Graphics character 128 is programmed with numbers 27, 112 and 48, while character 143 has 27, 112 and 49. This means that using GRAPHICS 8 (Code 128), Escape code 27 and p (Code 112 — for the Epson proportional spacing mode) is sent to the printer followed by '0' (OFF) (in other words GRAPHIC 8 sets Proportional spacing to OFF while GRAPHIC/SHIFT 8 (Code 143) Escape code 27 code 112 (p) and code 49 ('1') sets it to ON.

I decided that proportional spacing was an option that I could do without so I simply reprogrammed character 128 with 27, 82 and 3 and char 143 with 27, 82 and 2 which are the codes for Escape code 27, R (code 82) the Epson International character set selection with 3 for the English set and 2 for the German version.

Now to print £ I simply type in the # key but to obtain the hash I type in GRAPHIC/SHIFT 8 # GRAPHIC 8.

The Kempston E interface requires the tokens to be switched OFF before loading Tasword **COPY REM CHR$ 0)** and if the dip switch No 2 (SW pin 2 4) in the Epson printer is set on then line feeds are automatic. The Tasword Printer Linefeed should be set to 0 and the Printer Carriage Return to 13.

The Spectrum manual page 166 explains how Basic program lines are constructed.

Tasword or Spectral?

Carol Brooksbank has been using both wordprocessors for some time now and gives some advice to those about to venture into this field.

If you are thinking of buying a word processor program for your Spectrum you could find yourself trying to choose between TASWORD 2 and SPECTRAL WRITER. The programs are very similar. Both are superb word processors packing some very impressive features into a small enough space to leave room for over 300 lines of your creative genius in the Spectrum's memory. But there are small but important differences and to choose the one that will suit you best you need to know what the differences are.

In this article I am concentrating on those differences and not describing operations which are common on both if the only difference is the key pressed to perform the operation. Both programs perform all the basic functions to allow you to enter, correct, print, SAVE and LOAD text. The differences are in the extra features. Some you may think vital, some you will probably have no use for. The final choice will depend on your own preferences and the sort of work you do.

Screen Display

Both programs display the text on screen as it will be printed with 64 characters per line, the special typefaces they use for this are slightly different (Fig 1), and you may find one more readable than the other. If it helps you to decide, I prefer SPECTRAL, my husband likes TASWORD! In fact both are perfectly readable, but TASWORD also has a window feature to allow you to see the text full size if you have difficulty reading the condensed print. (Though this is a feature I have never needed to use.)

Fig. 1. 64 COLUMN SCREEN DISPLAY

This is a test piece, to show the screen display of TASWORD 2.

If I speak in the tongues of men and angels, but have not love, I am a noisy gong or a clanging cymbal. And if I have prophetic powers, and understand all mysteries and all knowledge, and if I have all faith, so as to remove mountains, but have not love, I am nothing.

This is a test piece to show the screen display of SPECTRAL WRITER.

If I speak in the tongues of men and angels, but have not love, I am a noisy gong or a clanging cymbal. And if I have prophetic powers, and understand all mysteries and all knowledge, and if I have all faith, so as to remove mountains, but have not love, I am nothing.

TASWORD is displayed with black print on white screen, SPECTRAL is cyan on blue, which appears white on black on a monochrome TV, but there is a menu option for changing the screen colours to suit yourself, and you can incorporate the colour changes into a backup copy of the program if you want to make them permanent.

Text Capacity

TASWORD 320 lines of text
SPECTRAL 350 lines

Tabulation

TASWORD has no tabs, but does have adjustable margins. These can be used to produce indented paragraphs which are justified. (Fig 2) SPECTRAL has full user definable tabulation as found on the best typewriters, which makes typing in columns very easy (Fig 3) but you cannot indent the right margin.

This feature will probably be a major factor in your choice between the programs. Producing work in columns is tedious with TASWORD and simple with SPECTRAL. On the other hand the ability to justify to less than the 64th column can be very useful. If you have a printer which can produce alternative typefaces you will have difficulty with larger than usual ones when using SPECTRAL, because 64 characters may occupy more than 1 line on the paper, making a nonsense of the justification and word wrap (Fig 4). You can overcome this with TASWORD by indenting the margins, reducing the columns per line (Fig 5).

Fig. 2. TASWORD INDENTED PARAGRAPHS

This first paragraph is typed with the full width, 64 column margins as set when the program is loaded. The paragraph below is typed with the left margin set at 7, and the right at 58.

If I speak with the tongues of men and angels, but have not love, I am a noisy gong or a clanging cymbal. And if I have prophetic powers, and understand all mysteries and all knowledge, and if I have all faith so as to remove mountains, but have not love, I am nothing.

Search facilities

Both programs use the arrow keys to move the cursor one letter or one line in any direction, but TASWORD also allows you to move the cursor back or forward one word at a time for rapid movement. SPECTRAL has very fast repeat, so that although the cursor moves one letter or one line at a time, if the key is held down continuously the movement is much more rapid than TASWORD's word jumping. The repeat speed may be altered by the SPECTRAL user if required. SPECTRAL also allows the cursor to be moved to the next full stop — moving a sentence at a time.

Both programs allow you to search for a particular word or phrase, but TASWORD also has the facility to replace every occurrence of a particular word or phrase with another word or phrase automatically — very handy if you discover that you have been misspelling a word throughout a document.

Insertion

TASWORD has an Insert Mode which allows you to insert extra sentences in the middle of a document without overwriting what is already there. With SPECTRAL you must first insert blank lines and then type the additions in them.

Block Copying

With TASWORD the start and end of the block to be moved or copied must be marked, and it can then be moved to lines which will be inserted above the line with the cursor in it. For some reason I never get this right, and always have to have several attempts before I get the block where I want it — but that is just a personal incompetence. If the block is copied it will still also appear in its original place, but if moved the original will be deleted and relocated.

SPECTRAL only copies text blocks. If you want to move a paragraph you must delete it from its original location after it has been copied to the new one. I find the copying method easier to handle though. You insert enough blank lines to accommodate the block where you

```

want to put it and specify that the block starting line and ending line is to be moved to a position starting line If you have not left enough blank lines to receive the copied paragraph you get an overlapping error report but the text is not over written

Justification

Both programs allow for automatic word wrap or justification to be turned on or off for single lines to be un justified and single lines or paragraphs to be justified SPECTRAL has an extra facility n that the whole text file can be un justified or justified The latter needs approaching with caution because every line is justified including headings and short end of paragraph lines which gives some very odd effects With SPECTRAL it is also possible to centre unjustified text in the page, move it to the left margin or move it to the right margin though I confess that I have yet to find a use for this facility

SPECTRAL has a bell — a beep which sounds near the end of a line which is handy if text is being entered without word wrap or justification using the program like a typewriter

Saving Text

With TASWORD the whole text file is SAVEd Spectral allows the user to specify that only certain lines of the text are to be SAVEd if required

Printer Controls

TASWORD comes with the graphics keys (G mode keys 1-8) defined as printer controls which suit Epson printers The user can re define these if required either to suit another printer or to change the controls available These are entered into the text where required for underlining bold type italics etc when using a full size printer

SPECTRAL uses the graphics keys in the same way but they are not pre defined and the user must define each one to his own requirements before making the personalized backup copy of the program One drawback with SPECTRAL — the program recognizes 0 (zero) as a null code so codes which include CHR$ (0) cannot be used With an Epson printer there are usually alternatives which use other codes but this could be a problem with other printers TASWORD recognizes 0 as CHR$ (0)

With SPECTRAL it is also possible to send a line feed or form feed instruction to the printer direct from the keyboard

ZX Printer

Both programs send text to the ZX printer in 64 column format TASWORD will also print any specified line at double height

Page Layout

TASWORD allows the user to specify the line spacing but has no facilities for page numbering or heading SPECTRAL has no line spacing facilities so double line spacing must be entered as a printer control However SPECTRAL has very valuable page numbering facilities Pages may be numbered or un umbered the starting page number to be specified by the user If it is a value other than 1 If the pages are numbered mode 1 will print the numbers at the top right hand corner of each page whilst mode 2 may be selected if the numbers are required to alternate between the top left and top right corners to facilitate binding SPECTRAL allows a page heading of up to 32 characters to be printed if required which will be printed on the side opposite the number Control characters may be used if this is to be underlined or in bold type etc

SPECTRAL also allows the user to specify the margin width and the number of lines on a page before a form feed is executed The default values which operate unless the user changes them centre the text on the 80 column page and give 80 lines per page To change the margins or centre the text with TASWORD, you must use printer controls to set the left margin On the whole SPECTRAL s printing facilities are more versatile than TASWORD s

Printing Part of Text

TASWORD will print from a specified line to another specified line SPECTRAL will print from the cursor to the end of the text If only a centre section is to be printed with SPECTRAL the cursor must be placed at the starting line a form feed printer code entered at the end of the portion to be printed and the printing operation stopped manually when the required section has been printed Alternatively a selected portion can be SAVEd separately and the section LOADed in place of the full text before printing Text written using TASWORD and saved on tape may be loaded in to SPECTRAL The reverse is only possible if the text is shorter than 320 lines

Supplementary Programs

The TASWORD user with a Microdrive can obtain a program called TASMERGE which allows text produced with TASWORD to be combined with data stored using the Campbell MASTER FILE program to produce personalized circular letters etc There is also the TASPRINT program, which produces alternative type fonts with suitable full size printers

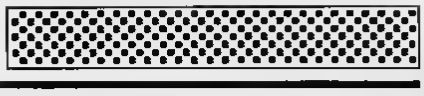
There are at present no supplementary programs for SPECTRAL though there have been rumours of plans to produce a merging program

TASWORD has an efficient customer backup service and esoteric queries are answered rapidly and helpfully The only letter I have ever written to Softek the publishers of SPECTRAL was not answered but Rotronics the manufacturers of the Wafadrive storage system will handle queries about SPECTRAL and they have issued a leaflet giving listings for an upgraded version

The upgrade gives several improvements to SPECTRAL s printing Parameters such as page numbers margin width and number of lines per page are selected at print time instead of going first to another menu option The printer controls are improved, so the program now recognises CHR$ (0), and there is a multiple copies option You can also elect to pause the printing operation at the end of each page to allow for changing paper when using single sheets

In addition a bug is removed from the program and there are improvements to some of the menus For instance the directories are displayed when loading or erasing a Wafadrive file The save program to wafer option is improved so that the program loads much more quickly The listing Upgrading Spectral Writer is available from Rotronics for 70p or for £1 you may send your original copy of the program to Rotronics who will upgrade it for you The listing is three pages of BASIC plus a number of POKEs so the extra 30p to have it done for you seems good value

Which to chose? It really is a personal choice My own preference is for SPECTRAL because the type of work I do makes the tabs the page numbering and heading and the page layout facilities very useful but I know that others prefer TASWORD I hope that this article will at least help you to choose the one which will suit you best



Xtending VTX5000 BASIC

David Knight presents a way of making Prestel more user friendly!

The program supplied in ROM for the VTX 5000 modem is very good but it does not have any microdrive or Interface 1 commands. I have written a program which when MERGED with the program supplied allows you to use the Microdrive and RS232 socket on the Interface 1. I will explain the modifications later.

First type in the Xtend program omitting lines 5000 & 9780 if you do not have a printer attached via the RS232 socket or if you wish to use the ZX Printer instead. Save the program with GO TO 9820. Now switch the computer off and on at the mains to place the Micronet menu in memory. Press any key to go the main menu and press BREAK (Caps Shifted SPACE). Now enter your prestel cartridge into microdrive 1 and type **MERGE * 1 "Xtend"**. This will make all of the changes needed to the program. Save the whole program with GO TO 9800. You should use a cartridge without the filename run on it.

In order to use your new program after switching on press any key and then BREAK. Now type NEW on key A and ENTER. Do NOT use option 7 on the menu as this clears the machine code from memory. Now enter your Prestel cartridge into microdrive one and type "RUN (ENTER). The program will autorun.

Catalogue

With the new program a few changes have been made apart from just saving and loading on microdrive instead of on tape. Most obvious is the Catalogue/erase file(s) option on the main menu. To use this place a cartridge in microdrive 1 and press any key. It will be catalogued. Then you have the option of erasing files. Once you have erased all of the files you need press ENTER without any filename and the cartridge will

be catalogued again. Then it will return to the main menu.

When loading or saving you are given the option to catalogue the cartridge before loading (or saving). When saving you are given the option of erasing any file with the same filename before saving the current file. This is similar with both screen files and mailbox messages.

If you wish to load a file from tape you may BREAK into the program and type **LOAD CODE**. Then type **GO TO 9700**.

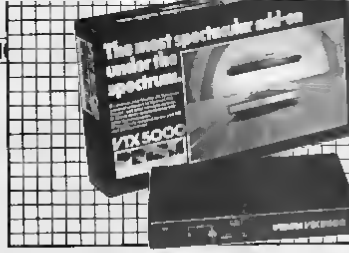
The final change is for users with a full sized printer attached via the RS232 port. (I use a Brother M 1009 but the program should work with other makes). It changes option 4 from copying to the ZX Printer to copying to a full sized printer. It is not perfect however as it will print block graphics as jumbled characters. If this is unsatisfactory for your needs insert your own copier from line 9700 onwards. It is perfectly adequate for printing pages of information but not for copying pictures.

My current Prestel cartridge contains Omnicalc 2 and the extended BASIC. This makes it possible to enter data into Omnicalc after getting it from Prestel. This is ideal for stockbroking etc. If you have Omnicalc 2 you may wish to do this. To start with you must copy Omnicalc onto cartridge (not using their method however as it uses the filename "run"). Copy it with one of the tape/microdrive copiers available preferably with the filename "runot". I use Trans Express by Romantic Robot but any other should do. The Prestel extended menu should be saved under the name "runpr". To do this change line 9800 appropriately and GO TO 9800.

Type in the autorun program and save it under the name "run" LINE 0. Now you can use the Prestel menu the same way as before except that you should choose option 2 when the autorun program loads.

Options

The full options are as follows: 1 — Load extended Prestel menu



2 — Load Omnicalc 2. 3 — Set printer to condensed mode. 4 — NEW.

Options 1, 2 and 4 explain themselves. option 3 sets a dot matrix printer into condensed mode, allowing 16 columns of data in Omnicalc 2 to be printed this I know to be true on a Brother M 1009, but may be different on other makes. I find that Omnicalc's Open 3 command is unsatisfactory as it opens channel 3 in 'b' mode which does not line feed on my printer. It is necessary to set the bit switches differently inside the printer, which is a bit sloppy. Option 3 corrects this and allows wider texts to be printed. However, if you switch your printer off while in Omnicalc it will be reset to pica sized characters so you will not be able to use condensed mode until you reload Omnicalc.

To get round this load Omnicalc and set up a file. When you wish to print it save the file and reload Omnicalc this time setting the printer to condensed mode. You may now print it out in sections if necessary. This autorun program may be expanded upon to load other programs other than Omnicalc such as Tasword 2. The Prestel menu may also be further expanded upon so do not be afraid to do so. But you need a knowledge of BASIC and perhaps machine code. I look forward to seeing further projects in this magazine and in others.

Tasword plus.

John Wall shows how to add Wordcount, Paragraph-count and Header facilities to Tasword II.

Word Count

Tasword Two has rapidly become the standard Word Processor for the Spectrum and has most of the features that purpose built WP's have two features that are missing however are a current word count and automatic header This is a machine code routine that gives in a fraction of a second the number of words typed into the file up to present Controlled from BASIC it also gives a paragraph count

The main problem is where to put the code In Tasword Two the text file is held between 32000 and 52480 with an extra 128 bytes after that obviously used for overflow routines The machine code section is held from 64780 to 65535 However the machine code also uses bytes lower than 64780 for data storage I chose 52610 as an address as far as possible from the data section of the machine code routines and no problems have arisen The main disadvantage is the extra time the program takes to SAVE and LOAD perhaps another 10 seconds each for the basic and the machine code

The machine code routine involves only relative jumps You might be puzzled by the 256 that is added to the DE register initially This is so that the test for the end of the text file is simplfied Just before the end is reached DE will hold 00 01 (hex — least significant byte first) and the next decrease of DE will leave FF 00 (255 decimal) and the D register will hold zero and the routine will return to basic The word count is held in the BC register so that the command PRINT USR 52610 will return the actual count (See lines 60 and 9360) The code could be made shorter by omitting the CORRECT FOR END OF LINE ERROR routine However this would give a false count because the routine would not separate two words one of which ends at column 64 and one which begins at column 1 of the next line There is a brief explanation of the code in figure 1

Header Routine

This enables the recall of a pre-entered address heading of up to seven lines It also pushed down the entered text so that the heading does not overwrite it There is a facility from BASIC to change the head ng at any time The header information is stored between 52660 and 53107 — 448 bytes or seven lines of text — and the code to manipulate it is from 53110 to 53145 The code is three almost identical, block transfer routines of 12 bytes each The first is described in figure 2

The second routine has the values in HL and DE interchanged The third routine moves the already entered text seven lines down and uses the LDDR instead of LDIR

The Basic at lines 9000 — simply calls the three routines in the right order Routine three moves the text then routine one prints the header Routine two is used when a new or edited header is needed See lines 9010 and 9040

Figure 1 the machine code routine

```
INITIAL CONDITIONS
Word count set to zero          LD BC  00 00
File length +255 20 736         LD DE  51 00

Load DE with address of destination	LD DE 7D 00 (32000)
Load BC with length of block	LD BC CO 01 (448)
Use LDIR	LDIR
Return to BASIC	RET

Basic Modifications

Modifications are required to Tasword Basic. There is not much spare room in the Basic area with Tasword loaded so some preliminary work has to be done. All the numbers in lines up to 1000 must be changed to VAL "number".

Provision must be made to display the information. One item on the STOP MENU has been changed and one has been added. Instead of "back to basic" there is "heading (for a letter)" and then "word count" has been added at the bottom of the menu.

1 Load Tasword in the normal way.

2 Edit every line to 1000 replacing numbers with VAL "number". Note that this doesn't apply to numbers in strings e.g. PRINT "2 — fix heading as typed", or numbers in variables e.g. y1, or initial line numbers but it does apply to GOTO and GOSUB line numbers. Each time you do this you save three bytes. You can check how much memory you have saved by typing in line 9990 and using GOTO 9990 every now and then. The new basic requires over 1000 bytes of extra space. If you need Microdrive routines you will need to make even more space by using VAL "number" right through the program.

3 Add or modify the lines as shown in the listing, making absolutely certain that the numbers in lines 9810 and 9820 are EXACTLY as printed as a single error could crash the entire program.

4 Type GOTO 9800 and ENTER.

5 Now delete lines 9800 to 9990.

6 Save your new program on tape (or Microdrive) by using SAVE "tasword" LINE 15. SAVE "tasword" CODE 52610,12925 (or similar M/Drive commands).

7 Check that the program saved properly by VERIFYing it. Use VERIFY "" VERIFY "" CODE.

The machine code is automatically called each time you go to the menu via SYMBOL SHIFT/STOP and again using option t. If you have made any mistakes at all then the program will crash and you will have to start again. Due to this it might be better to save the program after step 3 until you are sure it is working properly.

Once you have saved a copy as in steps 6 and 7 you can test it out by RUN. Going to the STOP menu you should see a word count of zero. Load a file or type something in and take note of the wordcount value. If you have a fairly long text file, try out the paragraph count facility. You will need to note the start line and the end line of the paragraph you want to count then go to the STOP menu and select "w". Remember the routine will count separate punctuation marks like "-" as complete words. The same will apply to numbers.

The Heading menu item allows you to print the heading already held at 52660 — or if there is no heading in then you can type your own in and fix it to be recalled at any time. However, once you have fixed it you must then re SAVE the program so that it will be available each time you re LOAD. You can do this saving by using item "t" on the menu.

ZX81 Fast Load

Ian Deaville lives in the fast lane in Rotherham and explains to the other ZX81ers how to join him.

This simple little program increases the Baud rate at which the ZX81 saves and loads to 1500. This means that the already awkward save/load system becomes even more critical however I have found that provided you keep your cassette in good operating condition, clean and with the heads regularly adjusted, then no real problems should be experienced.

You must make absolutely certain that the characters in Line 10 are exactly the same and the Line 1 REM must contain 244 characters. It might be wise to save a copy of this program BEFORE running it!

Having RUN the program, delete one line at a time lines 10 to 90 and type in — making sure Line 1 REM is still there — program 2. Prepare a cassette and RUN the program, it will save itself on tape and then set itself up ready for use. Before saving or loading any program load this in first, a program must be saved at this speed before you can reload it at the higher Baud rate.

Use RAND USR 32512 to save a program and RAND USR 32525 to subsequently reload a program.

PROGRAM 1

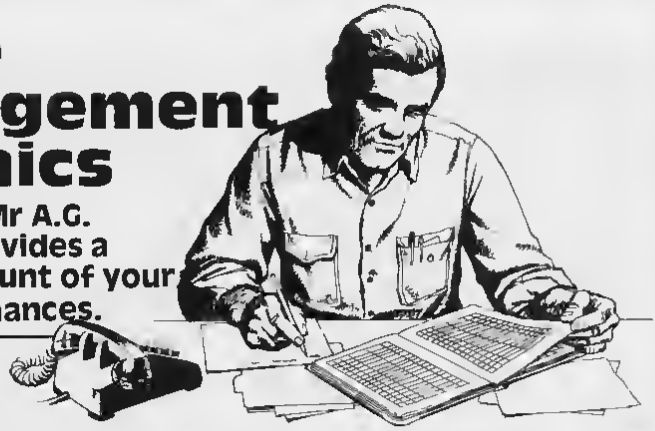
Home Management Graphics

Glaswegian Mr A.G. Cameron provides a graphic account of your domestic finances.



This program began as a simple routine which I used to plot a bar chart of my electricity bills since I moved into my new house! Gradually it has developed a proper INPUT routine, a SAVE routine, a facility to list the current data, and the ability to generate a vertical scale automatically. With the recent arrival of a new ZX printer it has also acquired hardcopy facilities.

There is extensive use of subroutines in the program as I am a confirmed structured programmer, and this is the easiest way to add new code to an old program.

Line 1030 sets up the array to contain your data, and lines 1040 and 1050 prompt for and accept a title for the chart. Line 1060 calls a subroutine to set up the required vertical axis scale, based on the maximum value you wish to plot. These statements are only executed on the initial setting up run of the program.

Lines 1070 to 1210 display the main menu screen and call the appropriate subroutine depending on the user's selection.

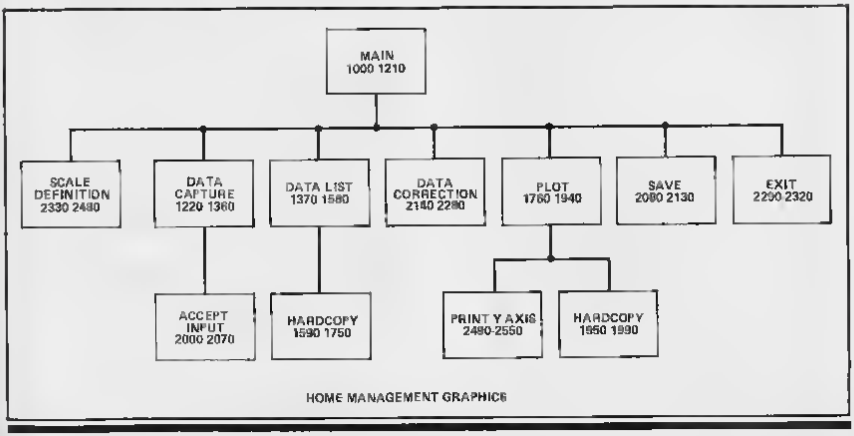
The rest of the program consists of the various subroutines for accepting (1220-1360), correcting (2140-2280), and listing (1370-1750) data, plotting the bar chart (1760-1940), printing the chart (1950-1990), and saving the program with its data (2080-2130).

Scale

The subroutine entitled SCALE DEFINITION (2330-2480) looks confusing at first glance. This sets up the vertical axis scale. The user is prompted for the maximum value he wishes to plot to (M). Lines 2380-2400 work out a number which when multiplied by four will give a value (N) greater than or equal to M. The labels for the scale are then worked out by accumulating N four times. D is the number which, when divided into the data, will produce a result less than 44, so that it can be plotted on the ZX81's 64 x 44 grid. Lines 2410 to 2470 store the vertical axis labels for later use by the plot routine.

The accompanying hierarchical diagram shows the relationships between all the subroutines called in the program. I find diagrams like these extremely useful as an aid to understanding the logical structure of a program.

After typing in the program and RUNning it for the first time you will be asked for a title for



HOME MANAGEMENT GRAPHICS

the chart then for the maximum value you wish to plot When you have responded to these prompts you will be presented with the main menu Enter the number of the option you want and press NEWLINE Option 2 — Input Data — is a good place to start!

To save the program and data enter option 5 On reloading the program will run automatically and go straight to the main menu, missing out the TITLE and SCALE DEFINITION steps If you want to change the scale or the title you have to leave the program (option 6) and enter

GOTO 1040

The Title and Scale Definition screens will be displayed again and you can enter new values Remember that if you use RUN again your data will be destroyed as the array A(24) will be re initialised To re enter the program at the main menu after exiting for any reason enter

GOTO 1070

There are still some enhancements which could easily be incorporated into this program For example how about fully automatic scaling? All you need is a fairly simple module called from the Plot routine to scan through the data array to find the highest value then call a modified version of the Scale Definition module to set up your axis labels A more interesting project would be to replace the existing Plot module with one which uses block graphics symbols to plot two values side by side (a 'clustered bar' chart)

Happy (structured) programming

Multi-File

R.L. Van Der Wardt sent us this versatile filing program from Holland — just for the record!

```
MENU  ENTER ALTER BACK FORWARD
      ORDER RESET LIST DELETE
      PRINT COPY  QUIT SELECT

          MODERN TANKS
Land      X1A2
country   Borneo
crew      234
armament  90mm .50in 7.62mm
weight    19.000
engine    Scania DS-116
km / h    55
```

This is a superb user friendly program with a wide range of possible uses. One key commands are utilised to the full and as it is written in Basic it can be modified to individual user requirements.

When you have typed in the program or loaded it from tape you have the option to load a file or define a record's layout. Obviously if this is the first time you have used the program you will need to define the layout.

The first entry is the file name and then you have to enter the number of fields you require (to a maximum of eight). Once this has been entered then enter one by one each of the field titles. When this is complete you should be passed to the main screen which gives the following options:

E — Enter a record
A — Alter a record, pressing ENTER skips over a field
D — Delete a record
S — Selects a required record
L — lists the whole file pressing a key halts the listing
B — Goes back one record
F — Goes forward one record
R — Reset goes back to the first record
O — Orders (sorts) the file alphabetically
P — Print as written to a Spectrum printer — Sinclair Alphacom or GP50s but can be altered by changing the program
Q — Quit. Goes back to the main menu

```

Tabcalc

An excellent spreadsheet program from J.F. Tydeman, specifically for the Wafadrive and Kempston E, but very easily modified to suit all systems.

TABCALC is a spreadsheet program designed to take full advantage of the facilities offered by the Robotronics Wafadrive and a line printer. An alternative listing is provided to permit the program to be used with the Kempston 'E' interface and a little hacking is all that is required to adapt the program to other interfaces and Microdrive. Tape facilities haven't been forgotten either, but the ZX printer just doesn't have enough characters per line to produce a useful print out from this type of program.

Entering the listing

Listing 1 is for the Wafadrive and uses the Wafadrive's Centronics port to feed the printer. Simply enter the listing and run the program. Should you wish to use Microdrive, modify the appropriate LOAD/SAVE commands in the routine starting at line 5000 but note the different way in which the Wafadrive handles the loading and saving of data. Enter listing 2 instead of lines 3000 to 3420 if you wish to use the Kempston 'E' interface. Listing 2 should be easily modified to suit other interfaces. Interface software should be entered instead of line 3020 and lines 3340, 3360, 3390 and 3410, which remove or implement Spectrum command word tokens, should be either left out or substituted with those required by your interface. If you wish to use a printer other than the Epson or Star you will have to check the printer codes against those given in your printer manual. If you do not have the Wafadrive, you will be unable to enter some of the lines as these use the Wafadrive's Extended Basic. Don't enter these lines which only occur in the Load/Save routine. Modify the Menu accordingly.

Program Description

The program, which stores information entered in a three dimensional array, uses the Spectrum's string handling facilities extensively, particularly when handling the screen display. It is menu driven and features eight principal routines. A description of these is given in figure 1.

Figure 1. Description of main routines

2000-2060	Defines certain variables representing either a screen location or the corresponding position in the array A$ and then prints the initial screen display.
2070-2220	The Input Logo. This loop enables the cursor to be moved and data to be entered or deleted as required. Subroutines located at lines 2230-2510 are called to print on screen as required. The principle options available are: Caps shift + '5' — Move cursor left Caps shift + '6' — Move cursor down Caps shift + '7' — Move cursor up Caps shift + '8' — Move cursor right Symb shift + 'A' — Return to menu Symb shift + '1' — Print at cursor Delete — Delete at cursor and backspace Enter — Move cursor to first position of next column. If end of array, print cursor at beginning of next line. ASC 2 Character — Print at cursor position 'T' — Entered to indicate the position of a sub total
2230-2310	Reprint screen display if cursor moves off right hand edge
2320-2370	Reprint screen display if cursor moves off left hand edge
2380-2420	Reprint screen display if cursor moves off top edge
2430-2470	Reprint screen display if cursor moves off bottom edge
2480-2490	'Enter' Subroutine
3000-3170	Print on screen a menu of various printer codes and format options. A little practice will enable you to select an appropriate format and print it anywhere desired on A4 paper. The BOX option is used to print out numeric data in the form of a table and should be used in conjunction with LINE SPACING for optimum effect. Print options are cancelled when printing is completed and must be re-entered if a copy is required.
3180-3310	Requests the input of a title and sends to the printer the data to be printed
4010-4070	Checks to see if the appropriate Totals flags have been reset. If not, goes to the appropriate subroutine
4080-4200	Sets all column totals initially to 0 and enters a series of nested loops to total each column. Safeguards included in lines 4150 and 4160 prevent the program crashing if a null entry is found, or the total becomes too big
4210-4350	Similar routine for Line Totals
4360-4370	Minor subroutine to set keyboard 'click'

REFORMAT/INITIALISE LINES 9000-9440

When using the program for the first time it must be formatted. To do this select option 1 from the Main Menu.

LINE NUMBERS	DESCRIPTION
9010	Gives the opportunity to return to the menu if the option has been chosen in error
9020-9170	This section permits you to define up to 15 column titles, each eight spaces wide. Line Titles and Totals columns are not included as they are formatted automatically. The maximum width of the array A$ is 136 characters, which corresponds to the number of characters which can be printed in condensed mode.
9180-9310	Routine for entering Line Titles. Up to 99 titles may be entered. If you wish to enter text commands you may enter a blank title in the appropriate line. This facility is also available when entering column titles. Used together it is possible to format the program to the required dimensions without entering titles and should be used if only text entry, or columns of non standard width are required. Titles may then be entered from the main program.
9320-9340	Permits column markers to be entered and should only be selected if columns of a standard eight character width are required
9340-9450	Defines certain variables used by the Printer Routine

Enter and/or Amend Data (Lines 2000-2510)

This routine is the heart of the program and is probably the most complex. It works by slicing the three dimension array A$ defined during initialisation and printing on the screen in two 'Windows'. These windows correspond to the following screen locations: Line 0 Column 8 and Line 20 Column 31. A '*' cursor which may be moved to any position on the screen using the cursor keys or to the next column by depressing ENTER should be positioned where it is required to enter or amend data. If the cursor moves off the screen in any direction the appropriate window is reprinted. A slight pause is experienced at this point. The Enter/Amend option MUST NOT be selected unless the program has either been Formatted or a Data File loaded otherwise an Error will result.

Sub-totals at any line may be selected by entering a 'T' in the first space of the column where it is required. These markers should be entered each time a calculation or recalculation is made as the calculation routine removes them.

Printer Routine (Lines 3000-3420)

The listing of this routine in the main program uses the wafadrive's centronics port. If however you do not have a wafadrive, listing 2 will give you the same printer facilities via the Kempston 'E' interface. Both listings are for Epson or Star printers but should be easy to modify for other printers. The routine provides an extensive range of formats and up to 136 characters per line may be printed in condensed mode if you have selected a format containing more than 6 x 8 character columns (excluding Titles and Totals) you will need to select the condensed printing mode.

Calculation Routine (Lines 4000-4370)

This routine should only be used if standard eight character columns have been formatted. If either, or both, Column and Line totals have been cancelled (Option 8) then flags will have been set to prevent the appropriate part of the routine from functioning. A safeguard is included which will prevent Totals containing more digits than the column width from being printed. An audible warning is given during calculation should this occur. As the routine can take some time if the array has been extensively filled with data, the column or line number currently being totalled is displayed on screen.

SAVE/LOAD routine (Lines 5000-5300)

A comprehensive routine to load/save to tape or wafer which could easily be adapted for use in other programs. If you are converting this routine to microdrive it should be noted that Saving or Loading Data on the Wafadrive is carried out by reading the different elements of the array A$. This is achieved with nested loops which are necessary with tape or microdrive. Note that Column Titles and all the variables necessary to run an unformatted version of the program are also saved.

Attributes (Lines 8000-8020)

A simple routine which enables Paper and Ink colours to be set from the Menu.

Clear numeric data (Lines 6140-6200)

Nested loops are used to clear the array with the exception of line and column titles. The routine then calls part of the format routine to allow the option of entering column markers.

Cancel/reinstate totals (Lines 6000-6130)

This routine prints a menu which gives options to cancel or reinstate Line and Column Totals. Flags are set and the array sliced according to the option selected. Data recorded in these segments is retained in memory. Exercising this option fully after formatting without Line/Column Titles or Column Markers enables text only to be entered. If you wish to enter a mixture of text and numeric data then enter numeric data first, calculate totals (if required), cancel Line and column totals and then enter text. If applicable, Column and Line Totals should be reinstated before sending data to the printer.

Important points

1. The largest number which can be entered is 9999999 or in decimal form 9999.99. Totals or sub totals which exceed this will not be entered.
2. Text comments must not be entered before totals have been calculated.
3. The program must be INITIALISED or DATA LOADED before selecting any of the other MENU options.
4. Should the program return to BASIC for any reason it may be restarted with GOTO 1. Do not use RUN as this will clear all data entered.

Across the Pond

by Mark L. Fendrick

It has been more than a year and a half since Timex left thousands of us in the lurch but as you can see, we haven't disappeared or given up the chip. This past year has seen many new products appear for our computers. Many of these are from the United Kingdom where the Spectrum (and Spectrum+) is still a popular micro computer. A few hardware items have appeared as well some developed specifically for the Timex adaptations in addition to modified Spectrum compatibles.

Some of the most important add ons which became quite popular in the last year were those devices which enabled the Timex/Sinclair 2068 to run Sinclair ZX Spectrum software. Unlike the situation here in the States, literally thousands of titles exist for the Spectrum in Europe and other parts of the world. Until now a good portion of the available Spectrum software would not work due to differences in the two operating systems. (Some software written in BASIC would load and run but the majority of the best programs contain varying degrees of machine code and do not work on the American machine.)

ROM and EMU

The EMU series of Spectrum emulators were the first of these devices to appear on the market — developed by Douglas Dewey of the Triangle Sinclair Users Group (206 James Street Carrboro NC 27510). For those of you unfamiliar with this emulator, it is a circuit board which is inserted into the Command Cartridge port and replace the standard T/S 2068 operating system with a pseudo Spectrum operating system. Using this device the vast assortment of Spectrum software which was previously unable to operate on a T/S 2068 will work just fine.

A second emulator which became available through many Sinclair distributors this year was the ROMSWITCH developed by G. Russell Electronics (R.D. 1 Box 539 Centre Hall, PA 16828, (814) 364-1325). Unlike the EMU emulator, this device gets permanently installed inside your computer, and is manipulated by way of a magnetic switch which sits on top of the keyboard. This does require opening of the computer, but is quite simple to install, although most dealers who sell this device also provide (for a small fee) installation service. As I explained in my earlier review of the ROMSWITCH, however, the installation requires no cutting or drilling is accomplished using nothing more than a screwdriver, and is simple enough to follow the instructions and run Spectrum software in about five minutes.

But, if you wanted to use any of the Spectrum hardware peripherals a Spectrum ROM is not enough. When Timex released the T/S 2068, for some reason they reconfigured the expansion bus and removed the 9V power which is present on the Spectrum bus. Because of this, add ons developed for the Spectrum are inoperable on a T/S 2068. This too has been remedied in 1985 with the Z-link. This device, when attached to a T/S 2068 containing an emulator of one sort or the other, reconfigures the Timex bus while adding the 9V required to run many Spectrum designed add ons. Among the dealers offering the Z-link are T.E.J. Computer Services (859 N. Virgil Avenue, Los Angeles CA 90029, (213) 665-5111) and Curry Computer (6344 W. Banff, Glendale, AZ 85302, 978-2902).

For those who went both the Spectrum software and hardware emulation in one device, Damco Enterprises (67 Bradley Ct. Fall River, Mass. 02720, (617) 676-2110) has marketed a device which they call the Rainbow Plus Interface. This interface contains both features necessary to run Spectrum software as well as to attach Spectrum hardware all in a single cased device. The Timex Command Cartridge port is available for those few Command Cartridges which were made available, and allows switching back and forth between modes.

UK sources

With all these emulators now available, US owners needed a source for Spectrum hardware and software. Many of the dealers who sell these emulators are stocking up on programs and add ons from the United Kingdom. Among these although by no means limited to these vendors alone, are Curry Computer, Damco Enterprises, Zebra Systems (78-06 Jamaica Avenue, Woodhaven, New York 11421, (718) 296-2365), and the English Micro Connection (15 Kilburn Court, Newport, RI 02640, (401) 849-3805). The English Micro Connection handles both Spectrum software as well as selling the Spectrum+ along with all of the popular add ons. (You may want to keep in mind that although there are devices which allow you to use both Timex and Sinclair software and hardware on your T/S 2068, there is no device which allows the opposite transformation. Owning a Spectrum eliminates the possibility of using most products designed for the T/S 2068.) One company, however, continues to take some of the most popular Spectrum software and modify it to work on the T/S 2068, often adding the ability to utilize many of the Timex's advanced features such as joystick control. Knighted Computers (707 Highland Street, Fulton, NY 13069, (315) 593-6219) has obtained rights to translate all of Ourckslva's Spectrum line. In addition to the many fine games (such as Fighter Pilot — modified to use the Timex joystick port), Knighted Computers also has many fine serious applications software as well.

One of the best, and most inexpensive ways of getting British software is from the dealers in England themselves. The dollar is still quite strong as compared to the British pound, and usually this results in the price being lower when ordering direct. Many British dealers accept MasterCard and/or Visa which makes the handling of the exchange of currency quite simple as the bank handles all of that for you. The most efficient company I have discovered to date also has the most extensive catalogue I have yet seen. To make matters even better, their prices are quite low, while the quality of their service is quite high. On any order I have placed with them, I have received my tapes within ten days. (I have often had to wait longer for programs from American companies). Write to Speedysoft (37 Church Road, London SW13 9HQ, England) for your copy of their large catalogue.

Mass storage

In 1984 the most eagerly anticipated release was the modem for the T/S 2068, and then the Smart II software to accompany it. In 1985 the prize was mass storage devices. As advanced as the T/S 2068 is, it is handicapped by the necessity of using a cassette based mass storage system — slow and clumsy — with no method of automatically turning the cassette player on or off. One of the features which drew many of us to the T/S 2068 in the first place was the promise of microdrives such as those available for the ZX Spectrum. Of course Timex abandoned us before they brought it to market, so third party designers stepped in and took up the slack. Unlike the modem, which was already designed and ready for release, independent developers had to work from scratch to meet the need. Today the Sinclair owner is in a position quite unfamiliar in the past, and a choice of systems is available from which to choose. Those who want a traditional disk drive system have at least two from which to choose. AERCO (Box 18930, Austin, Texas 78760, (512) 451-5874) which has been producing interfaces for the Sinclair computers since almost the beginning, has finally released its long advertised disk drive system. A second system has been developed and marketed by Ramex International (17620 26 Mile Road, Washington, Michigan, (313) 781-5800). To compare system specifications write to both companies and request more information.

Also now available is a microdrive for the T/S 2068. Although this is not the system promised by Timex, it is from a company which has been involved with the Timex computer from the time when the T/S 1000 was the only micro in the line. The A&J Microdrive Com-

pany (1050 East Duane Avenue Suite1 Sunnyvale CA 94086 (408) 732 9292) first developed a m crodr ve w th in terface for the T/S 1000 and when the T/S 2068 came onto the marketplace they responded with the compatible model Utilizing a stringy floppy wafer which measures one and three quarter inches by two and one half inches by one quarter of an inch the r operating system comes on an EPROM which requires very simple additions to the LOAD and SAVE statements to activate the micro drive With much increased speed and automatic on/off under software control this reasonably priced system solves many of the problems of the original cassette based mode To make th s package even more attractive the A&J interface allows use of the cassette port and contains a parallel printer interface

A final mass storage system believe it or not is from Timex Computer Corporat on! No not the group formerly headed by Dan Ross in Waterbury Connecticut but by Timex of Portugal Zebra Systems has signed an agreement with Timex of Portugal to import the TC 2088 system to this country This is a T/S 2068 look alike with an American ROM and a Spectrum compatible expansion bus The computer also comes with a Spectrum emulator (which does not work with the T/S 2068) giv ng this computer nick named the Silver Avenger the best of both machines Design ed as part of this system is a matching 3½ inch disk nterface and drive Zebra Systems has made this disk system available not only for the TC 2068 but for the T/S 2068 as well

Zebra

While we are on the subject of Zebra Systems you would certainly want to write for their catalogue currently the largest T mex/S nclair catalogue around One of the reasons for this is that Zebra still actively supports the Timex line carrying most of what is available from other sources as well as continuing to produce new products of their own for our machines Last year they released two excellent hardware developments — the ZebraTalker II and the Zebra Graphics Pad — for the T/S 2068 They backed up these products with some excellent software to go with both ZebraTalker II comes w th two fine programs to assist in creating the speech you require from your speech synthesizer The phoneme editor helps you to create the phoneme strings utilized by the device and add them to your own programs The Text to Speech software (which you can merge with any program you have or write) allows you to type n text wh ch automatically gets converted and sent to the ZebraTalker Nothing could be simpler

The Zebra Graphics Tablet is an interface designed to connect a supplied Koala Graphics Tablet to your T/S 2068 The software provided allows you to draw on the tablet with a stylus (included) and have that drawing transferred to your TV or mon tor screen Copies can be sent to your T/S 2040 printer if you desire Two new releases also work with your Zebra Graphics Tablet — Coloring Book and Tech Draw Coloring Book s terrific for the children who are always around wanting to use your computer A number of pre drawn d fferent scenes are available for the k ds to colour us ing the simple menu provided Unlike traditional coloring books a child can undraw anything and the picture can always be restored to its original uncoloured condition simply by reloading the software A se cond program — Tech Draw — comes with features such as various textured shadings brush strokes selectable input and output (to a T/S 2040 printer or a full size printer in two sizes) on convenient pull down menus Of course you may save any of your creations

D.I.Y.

Any of you who regret miss ng the time in 1981/2 when Sinclair offered the ZX81 as a do it yourself kit here is your second chance Both Zebra Systems and Sunset Electronics (2254 Taraval Street San Fran cisco CA 94116 (415) 665 6181) are now offering the kit once again They come with all parts and instructions as well as a lim ted warranty This is a great item for user groups as quantity discounts are available They would make fine presents too (Personal note to my wife k ds parents or whoever — I wouldn t m nd getting one!) Remember that anything still available for the T/S 1000 will work on the ZX81

Before we leave the topic of graphics I would like to remind you about three fine programs Both Multi Draw (Knighted Computers) and Draw II (Peach II) are multi featured graphics programs which produce ex cellent results A new entry n the field s Pixel Sketch and Graphics Editor from Lemke Software Development (2144 White Oak Wichita KS 67207 (316) 687 0315) I am now putting this program to a full test but n the meanwhile you may want to write to Lemke Soft ware fo the r full catalogue

There are still many products which I have simply not had a chance to fully test yet which will be topics n future columns One of the most interesting cur rently on my desk is from G Russell Electronics It is an ex perimental program for the T/S 1000 (and T/S 1500 and ZX81 of course) to create multi coloured graphic scenes on your black and white TV with no hardware changes or additions other than an optical screen which goes over your TV screen You are supposed to be able to paint n 8 colours in cluding various shades of red blue yellow black and white I am quite anx ous to try this (got ta find a black and white set) and will report to you as soon as I do

I was saddened to hear as I prepared to write th s month s column that Hawg Wild Soft ware was throwing n the towel and going out of business Your presence shall be missed Gary

You may also want to write to the following companies for copies of their Sinclair related catalogues

E Arthur Brown Company 3404 Pawnee Drive Alexandria MN 56308 (612) 762 8847

Heath Computer Services 950 East 52 South Greentown IN 46936 (317) 628 3130

Twenty first Century Electronics 6813 Polk Street Guttenberg NJ 07093 (201) 869 2616

Any dealers that I missed please accept my apologies and send me a copy of your current catalogue

All At 'C'

We take a close look at Metacomco's version of the C language.

This is a package designed for the professional C programmer but is also user friendly enough to be considered by the home user. As can be expected for such a specialist program the cost is high at £99.95 but for this you get a plug in EPROM containing part of QLC two cartridges with the compiler phases 1 and 2 and a third cartridge with the Screen Editor C run time system and the linker. Also included is a 200+ page manual. Before looking at the package in depth it may be worthwhile looking at the language.

The C Language

Although Metacomco say C is a high level language it is generally considered to be a medium level one and was designed for general purpose applications on the UNIX operating system by Dennis Ritchie. This language has several advantages. For a start it is a compiled language which means that the final code is in the machine language of the processor and so will perform at very high speed. Secondly it has excellent data structures and fairly structured control flow. Portability is a major advantage of the language a program written in C for the Hisoft C compiler for the Spectrum will work on any other C compiler providing of course no machine specific code has been used.

Due to this portability a large library of general functions are available which saves having to program many routines yourself. C has many followers who are ardent fans but to be fair it also has its critics.

Metacomco's C

This is a full version which is as compatible with the original as is possible. Designed by Lattice it is based on their tried and tested 8088/86 C compilers and includes a large library of UNIX and QDOS functions, full floating point arithmetic. Macros and extensive error trapping and messages.

The screen editor is the main unit for creating C routines and is very flexible with a large set of cursor and editing commands user defined windows and the ability to run multiple versions. The linker will take the files created by the editor and the library and link them together before compilation into the final program code.

In Use

OK so far all this could be gleaned from the press release and advertising claims of Metacomco now we come to the acid test. Using it.

For a start and Metacomco admit this the microdrive tapes are a risky media for storing such an expensive program. Backup tapes are essential and preferably a disk drive for maximum security. I used a 40 track with the Technology Research interface and I have not had any problems with my copies although Metacomco are slack in not providing any built in backup routines. Users at this level are unlikely to possess similar quality equipment. Most importantly even though the manual is a well written and lengthy tome it is a functional description only and no teaching of the C language is undertaken. Users are assumed to be proficient and if not they are directed to the C bible *The C Programming Language* by B.W. Kernighan and D.M. Ritchie and published by Prentice-Hall. An alternative is *C at a Glance* by A. Denning and published by Chapman and Hall.

The manual covers the usage of all the programs and gives in detail the few departures from the standard. The portable library is likewise explained in detail. Some of the library programs are concerned with memory allocations some are I/O routines and finally there are a set of Macros for general file string and mathematical operations.

The Editor is a joy to use it can be soon mastered and entering programs and routines is simplicity itself. However using the compiler is a fairly lengthy business and needs to be approached carefully and step by step. Experienced programmers will not find any problems but the novice may find it confusing.

Once the program or suite of routines has been created onto tape or disk then the first part of the compilers is used. This compiles the source programs into an intermediate code ready for use by the second part of the compiler. Finally the object code is linked to any other routines and the completed program may be saved.

Opinion

This must be the definitive C compiler for the QL. Everything is provided for the experienced programmer, and if they are competent in C they will find it easy to use this well produced version. I entered the sample programs supplied and also a couple of others that I had developed on the Spectrum and all compiled and operated without any problem. It seemed too good to be true!

For novices or those wishing to learn it could be looked at as an investment. If you approach it seriously then all the features you could ever want are provided.

The price makes it prohibitive for the home dabbler and you must be certain that you will be intending to get full value out of the program. It is perhaps wise to buy a teaching book to study before investing in this program (you'll need it anyway).

Finally yet another moan about the microdrives. I know it isn't Metacomco's fault but after making only one backup copy one of the tapes failed. A frustrating and expensive problem.

QL C — priced £99.95 is available from Metacomco, 26 Portland Square, Bristol BS2 8RZ.

Quicksoft

Clive Smith tests his skill and strategy in this software selection.

Waterloo
M.C. Lothlorien
£9.95

Ever since I saw Rod Steiger storming around as Napoleon I've been interested in this battle. Unlike most wargames for the computer you do not command the British side or the historical winners yep you get lumbered with being Napoleon.

Although cast as the underdogs a few liberties have been taken in order to enhance the playability of the game the French army has been increased to five corps of infantry instead of four and the Prussian army will arrive earlier than in reality to make your task a little more difficult. Purists may not approve.

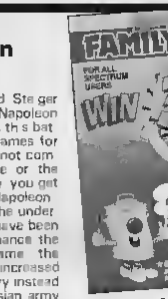
The game is played by means of graphics and single key presses form a series of option menus. This allows for an unexpected variety of actions to be taken quickly and easily.

The playing area was a little small and at first I was confused due to the booklet map being printed with the French army at the bottom and the English at the top, but onscreen the map is rotated 90 degrees clockwise. I spent quite a while trying to move the wrong army.

Once I began to play properly I soon mastered the first and easiest of the three levels and achieved a decisive victory on my second play. For what appears a simple slow intellectual exercise I found it unaccountably gripping and addictive.

Not tonight Josephine. I'm going to have another whack at Wellington.

OVERALL ★★★★



321 Family Quiz
TBD
£9.95

Everything is thrown into this blatant attempt at exploiting YTV's inexplicably successful show. Ted Rogers narrates the instructions and presents each section on the tape, and a wide range of prizes from toy Dusty Bins to a seven day holiday in Spain is up for grabs.

The program is in three sections and will operate on all Spectrums including the few 16K versions still in existence - no source of possible sales has been overlooked!

Section one is the quiz part and three families take turns in answering general knowledge questions by pressing True or False. Section two is a simple arcade sequence and section three is a lucky dip with not even the convoluted clues of the original TV program to help.

Fans of 321 will possibly find something of interest here and so might avaricious individuals although it is worth pointing out that even if you achieve everything possible you do not get the prize but only an entry in the Grand Draw for these prizes. It is realistic in that the game had the same effect on me as the TV show - I fell asleep! Personally I think this program would be better stuffed into Dusty Bin!

OVERALL ★

Rothmans Football Quick Quiz
Cassell Ltd
£8.95

Here is a just for fun quiz no tie-in with famous personalities or TV shows, no offers of fabulous prizes, in fact the worst that it could be accused of is the plug for Rothmans.

For fans of the art of spherical dexterity this is a challenging test the knowledge. 18 sets of questions totalling 1000 questions in all and covering every aspect from general to trivia and non league football.

The quiz is well presented giving three variations in play format. Assigned, Three in a Row and the Race. A full quiz can be played which involves a combination of all three.

Not a lot to add except that it is a good example of how the quiz can be implemented on a computer and it is a must for football fanatics.

OVERALL ★★★★

Endurance
CRL
£7.95

Beware! From the picture on the cover you may think that this is an arcade game – not so. This is in fact a strategy and tactical game *per excellence*, if this game is bought by mistake then it may well convert a few hardened arcade addicts.

One to six players can compete and the keys are redefinable or a Kempston joystick can be used. Games may be saved to tape to allow you to continue with a game later on.

The first stage is in selecting the bike components and the riders, this is done by choosing between options displayed graphically. During the race messages will be given and you can send instructions to your riders. Wear and tear must be dealt with as well as refuelling. Unexpected problems such as headlamp failure and crash damage will add to your headaches.

As a motorbike fanatic I loved this game and I suppose you had better take that into account when looking at my rating. I find the arcade simulations of motorcycle racing unsatisfying but the program seemed to produce all the atmosphere and excitement of the track. I felt sorry for the unsung managers of the teams after playing this.

OVERALL ★★★★★

Strongman
Martech
£7.95

Oh no! I thought my TAC2 indestructable joystick had just snapped whilst playing Supertest and I couldn't afford to get another to test a similar game.

Well there is an interesting option in this game. This infamous left/right action only has to be done at the start of the game to set the overall strength which is split between each muscle thereafter it becomes a matter of strategy in assigning the amount of power and effort each muscle puts into each task.

Fortunately for me the training session of building up your strength can be bypassed and a random amount of strength is allocated. The tasks are Truck Pull, Log Chop, Barrel Loading, Car Roll, Fairground Bell, Sumo Wrestling.

During each event some action timing the pressing of the fire button etc is required and I was not going to get out of the L/R action that easily for Barrel Loading and Fairground Bell we were back to it and the keyboard had to suffer for the sake of this review.

Martech have tried to do something a bit different and have succeeded on the whole the graphics are not as detailed as in some varieties of this game but the slightly more varied gameplay and extra thought required make up for it. Worth your consideration.

OVERALL ★★★★

Spectrum Lessons

By the time you read this the new government scheme to provide additional educational software support for schools should be well under way. This scheme will make new programs or the equivalent money available to schools the differing procedures dependent upon the individual Education Authorities.

If you are the teacher responsible for purchasing new software then unfortunately the age old problem of suitability still exists. If you are lucky enough to have access to a Teachers' Centre with a software library for reference then the problem is not so bad. Often however word of mouth recommendation or impartial reviews are the only means by which it is possible to be sure of obtaining the right program for your needs.

Classroom Adventures

I personally must admit a particular preference for adventures within the classroom. It is possible, with a certain amount of guidance from the teacher or even parent if these are used at home to extend an adventure program into the basis for a whole curriculum topic.

Jack in Magicland has been available for some time now and is the first in a trilogy of adventures for children aged 6-12. All have been written by a Primary School teacher and compiled with *The Quill*, the adventure writing aid by Gilsoft.

On first impressions there is nothing spectacular to make you leap with anticipation - no loading screen and only a block graphic title page. However the delights await within.

The first adventure is based upon the story of Jack and the Beanstalk and is text only. I tried this with several groups of 9-10 year olds and they found no difficulty with the readability of the text although it would probably be rather heavy going for the average 8 year old.

The story begins with the pupil taking the part of a very lazy Jack, reluctantly entrusted to go and sell the last remaining item of value, the family cow. Once accomplished the adventurer proper begins.

As with all adventures each location is described for the player and a response is then expected. What makes this adventure so real are the very atmospheric descriptions. The children loved them and were in no way disappointed by the lack of graphics. Indeed this is a plus point in that they can go away and recreate their own impressions of the locations and the characters which they meet. Despite the fact that there are no pictures the interest is maintained by the text and by careful use of colour in paper and ink which go someway to adding to the scene description.

Keyboard entries are simple using NORTH, SOUTH or the standard verb/noun statements such as GET SWORD, GIVE BOTTLE or abbreviations. Some text is lit up to provide clues for the next action. At some points these represent the only course of action so it is wise to take heed of them!

The children I tried this with worked in groups and took great care in decision making, especially after their first attempt resulted in being sent to bed by Jack's mother for being foolish! It was encouraging to see the amount of discussion that took place, even from children who normally took little part in class activities. As the adventure proceeded it became harder and harder to get them away from it - they were delighted at every new location and puzzle!

Working through the adventure the children discovered many locations and puzzling situations. This gave plenty of opportunity for them to decide the necessary form of commands to give the computer. The brief duplicated Teachers Notes suggest that the program will encourage reading and spelling, techniques and this undoubtedly is the case, if only for the fact that the computer will not accept incorrect spellings!

Watching the children play this adventure it was possible to see many ideas which can be extended into other areas of the timetable and overall I felt that the program has a great deal of potential. Language work is just one area in which the possibilities are almost endless.

On the minus side are a few minor points. Lots of text to read on a single screen, and a few idiosyncrasies have crept into the storyline (in the giant's treasure room it is impossible to lift a reel of thread but you can carry a chest of treasure). Care needs to be taken too when using the REDESCRIBE option, this can occasionally put you back in a situation from which there is no way out!

For those who require graphics, Turtle will provide a photocopied booklet of delightfully amusing illustrations and a map.

The notes supplied provide all the answers for teachers without the time to go fully through it together with a few related ideas for further work. I feel that this is one area of the package that could have been more substantial for those who do not have the ideas flowing from their fingertips, but on the whole this in my opinion is a worthwhile and value for money program. And the verdict of the children? Great!

Pirates!

The third of the adventure trilogy, *Jack and the Pirates*, moves away from a fairy story setting and puts Jack in the days of pirates and Long John Silver.

For me this does not have the same initial appeal or the amusing descriptions but the further the children got into the storyline the more possibilities became apparent. The problems are more complex here and a map soon becomes essential. This is a worthwhile exercise in each of the adventures and again, can lead to a lot of follow up work.

As well as looking out for themselves in this adventure it is also necessary for the players to take care of a certain character encountered at the start, he can help you out if you don't lose him.

As a basis for project work these adventures have been well structured and offer considerable potential. They do not contain a wealth of related suggestions and this might be an area for improvement in the future but, with a little thought and time they could be very valuable additions to your Spectrum educational library.

Halley's Comet

Finally to something entirely different. *Halley's Comet (Your Own Planetarium)*. In view of the current media sweeping certain sections of our populace this is very timely although by no means original in idea.

There seems to be a superabundance of astronomy programs at the moment however this deals specifically with Halley's Comet and after only a short time in which to look at it seems to be an extremely detailed program.

It is possible to go backwards and forwards in time to see the differing star planet configurations for any given date. There are extensive options for viewing planetary motions and star charts as well as being able to use one of the two programs as a computer equivalent of an Orrery (model of the solar system).

An almost endless list of key functions puts you in command of your own computerised planetarium and these take a little getting used to. A little practise however soon makes these second nature.

The program has zoom facilities as well as being able to follow movements of planets and stars in daylight. One rather silly suggestion is to take your television outside at night to compare your display with the night sky. Notwithstanding this however the program seems very competent. It has a comprehensive duplicated booklet which is very necessary to get used to all the different keys!

If you require a program to keep tabs of the Comet on cloudy nights then this well worth a look.

Jack in Magicland, Jack in Crazyland, Jack and the Pirates. Spectrum 48K £5.95 each from, Turtle Software, Bridge Street Mills, Witney, Oxon OX8 6YH.

Halley's Comet. Spectrum 48K £8.95 from Anima Scientific Computing, 33 Lilac Walk, Hebburn, Tyne and Wear NE31 2JT.

Data Creator

Good things come in small packages they say, and Bill McIntosh's useful program proves it!

This program takes code from memory between two specified addresses and creates DATA statements which contain the code in string form using hex notation. Obviously this can save much time and effort especially in preparing programs for submission to magazines.

The code has been deliberately kept inside string quotes in order to keep the ammount of memory that the statements take up to an absolute minimum.

To use the program first of all CLEAR RAMTOP to some value below 65000. Type in the HEX loader followed by the DATA lines. When you're happy that all is correct then type RUN and wait until the message 'Out of data' appears. The program code will then have been placed into memory at 65000 and is about 220 bytes long. When you have done this SAVE the program code with SAVE "DATACREATE" CODE 65000,220.

The start address of the code that you wish to convert should be POKEed into 65000 and 65001 and the address of the last byte should be POKEed into 65002 and 65003 using the method in Figure 1 as an example.

```
10 LET X=30000: REM start address
20 POKE 65000,X-256*INT (X/256)
30 POKE 65001,INT (X/256)
40 LET X=30234: REM end address
50 POKE 65002,X-256*INT (X/256)
60 POKE 65003,INT (X/256)
```

Type and RUN and then NEW. Before running the machine code there must be one program line in BASIC numbered 9999. This can contain anything that you like. It may be of more use though to use 9999 as a REM statement to make notes about the listing. The data line numbers start from some number, depending on the amount of code, increase in single steps, and always end at 9998.

Type in RAND USR 65004. When the operation is complete you will find that the data statements containing your code have been inserted. The listing can now be SAVED or PRINTED in the normal way.

To POKE the code back into memory simply change X in line 5 of the HEX LOADER to the start address of your code and run.

```
  5 LET x=65000: LET a=10: LET
b=11: LET c=12: LET d=13: LET e=
14: LET f=15
  10 READ a$
  20 FOR n=1 TO 15 STEP 2
  30 LET w=VAL a$(n)
  40 LET w=w*16: LET w=w+VAL a$(
n+1)
  50 POKE x,w: LET x=x+1
  60 NEXT n
  70 GO TO 10

Conversion tips

A guide to ZX81/Spectrum program conversions from David Nowotnik.

The versions of BASIC offered by the two ZX computers are so similar that many programs for one can be used by the other. The ZX81 has only two commands which are not present on the Spectrum, SCROLL and UNPLOT, and these should cause you few problems when converting ZX81 programs to the Spectrum (see Table 1).

There are quite a lot of commands and functions on the Spectrum which are not available on the ZX81. A list of these appears in Table 4. The stars indicate those commands and functions for which there is no simple translation to ZX81 BASIC. Those for colour and sound can be ommitted, but you will have to find some alternative for the high resolution and file I/O commands.

The command PLOT appears on both computers, but the effect is quite different, so beware! Another tip: PEEK and POKE should be used with caution. In conversion, addresses will almost certainly have to be changed. Some of those changes appear in the tables. A command such as POKE USR 'a' on the Spectrum indicates User Defined Graphics. ZX81 users don't have this facility, so you'll have to omit this and use a standard character instead.

ZX81	Spectrum	Comments
SCROLL	RANDOMISE USR 3582 or LET t=USR 3582	If the program uses random numbers, they could become rather predictable with the first option. If so, use the second, using a variable (in this case t) which is otherwise not used
PLOT Y,X	PRINT AT 21−Y/2,X/2;	Print the appropriate quarter square graphics character
UNPLOT Y,X	PRINT AT 21−Y/2,X/2	Print a space, or the appropriate quarter square graphics character

Table 1 ZX81 to Spectrum conversions

Spectrum	ZX81	Comments
BIN eg LET y=BIN 10010101	LET y=(decimal no.) Conversion to decimal: 10010101=149 128 64 32 16 8 4 2 1 Add these numbers together when a 1 appears at the appropriate position in binary	BIN allows the representation of a number in binary. On the ZX81 use the decimal equivalent, but beware: BIN is often used with User Defined Graphics, which are not available on the ZX81
READ/DATA eg READ x,y DATA 50,60	LET LET X=50 LET Y=60	READ and DATA are used to store a lot of information in a program. Use LET instead
DEF FN and FN eg DEF a(x)=SQR x LET t=FN a(t)	 LET X$="SQR X" LET X=t LET T=VAL X$	The defined function can appear in a string. Use the keyword for built in functions (eg SQR). The equivalent of FN may need 2 lines, as shown
PLOT	no equivalent	
SCREEN$ eg LET a=SCREEN$ x,y	LET A=PEEK(PEEK 16398 +256*PEEK 16397+1+Y+33*X)	Used in interactive games to detect characters in the display file. Note — this formula only works when a RAM pack is fitted

Table 2 Spectrum to ZX81 conversions

ZX81	Spectrum	Comments
1 FRAMES POKE 16436,255 POKE 16437,255 LET T=(65535−PEEK 16436−256*PEEK 16437)/50	POKE 23672,0 POKE 23673,0 LET t=(PEEK 23672+256*PEEK 23673)/50 For times greater than 10 minutes you can use byte 23674 as well	Both computers have a counter which accurately varies by 50 every second In the example use the first line to start the clock The variable T will have the time in seconds after the start The counter can only be used for 10 minutes
2 Line number zero		
POKE 16510,0	POKE 23756,0 (As the start of BASIC can move eg with microdrives) use with caution	Converts the first line of a program to line number zero which cannot be edited, and so is protected
3 RAMTOP POKE 16388,X−256*INT (X/256) POKE 16389 INT (X/256)	CLEAR x	Creates a safe area at the top of RAM starting at address x for storing data machine code etc

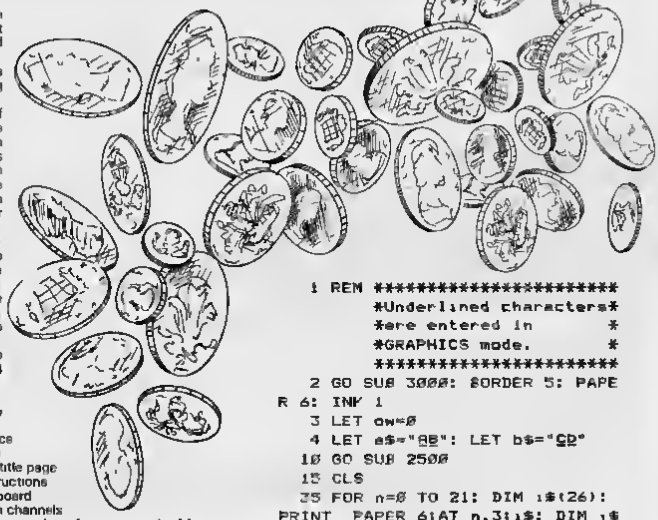
Coin Drop

Hugh Davis has been visiting the Hereford arcades and offers you the chance to get rich quick!



The program 'Coin Drop' is a version of the coin-in-the-slot game popular in seaside and fairground amusement arcades. A coin is allowed to fall down a vertical pin-board bouncing from one pin to another in a random path until it reaches one of six coin-bearing channels. The channels contain anything from zero to four coins, and the aim is to bring the total up to five, upon which all five will drop to the player's advantage. Coins won in this way can be retained or reinserted. The result is influenced principally by the decision when to allow the coin to fall during its passage along the top of the board. However there is the facility to 'nudge' the coin just once in either direction. The fourth channel swallows up all coins and so should be avoided! You have only six coins to start with, and so it is essential to make an early gain.

Figure 1. Lines

3000-3050	define graphics
2500-2538	write the title
2540-2580	illustrate the title page
2600-2670	print the instructions
35-65	draw the pinboard
75-85	draw the coin channels
1000-1050	draw a random number of coins in each of five channels
1105-1160	transport a coin across the top of the board
1200-1320	cause the coin to fall as far as the first pin
135-190	cause the coin to bounce down the pins as far as the coin channels
500-560	make the coin coma to rest immediately above the next highest coin in its channel
604-615	empty a filled channel
2000-2080	print the Score Sheet at the end of the game

Figure 2. Variables

a$	top half of coin
b$	bottom half of coin
a to f	no. of coins in the channels
g	no. of coins in the channel being topped up
k	decides direction of horizontal motion
m	distance fallen
l	gross loss
w	gross winnings
nw	net winnings in any one game
ow	overall winnings
cr	coins in hand
(x,y)	coin coordinates

Problem Page

This issue I had an offer I couldn't refuse. Ray the Ed asked me to give some advice on how GRANDSTAND, which we published a couple of months back for the ZX80 could be converted for the Spectrum. Apparently he has been inundated with pleas for help!

Data

The first thing is that DATA is simulated in lines 1 to 7, so change lines 1 to 7 to DATA lines so that each follows the format

```
1 DATA "LIVERPOOL",
"MAN UTD","NOTTM F",
"Q P R",and so on
```

until all the names are entered. There is no need to be precise with each name being nine characters long but a maximum length of nine characters is wise.

The main use of this Data is made in lines 22 to 38, so remove all these lines and replace them with

```
22 RESTORE A
23 FOR c = 1 TO B: READ o$
   NEXT c
24 FOR c = 1 TO LEN o$
25 PRINT o$(c); : PAUSE 25
26 NEXT c
28 RETURN
```

Briefly, the subroutine at line 31 does the same as the RESTORE (now in line 22). Line 23 reads the Data until the required name is in o$ and the loop from 24 to 26 prints out each letter of the name. PAUSE 25 causes a slight delay to imitate the TV teletype style printing.

Lines 9952 and 9955 need to be changed to RESTORE A to allow for the removal of the subroutine at 31. If you find any GOSUB 30 lines which I've missed then don't forget to change them yourself to RESTORE A.

The random number routine is different in the ZX80 and ALL occurences of RND(number) should be replaced by

```
INT (RND * number + 1)
```

So the line 120 should read

```
120 LET c(a) = INT (RND * 10
+ 1) + 10
```

Save

The save routine is pretty straightforward, but I would change it to 1550 SAVE "grandstand" LINE 1010, and Line 1560 to GO TO 1010.

The PEEK 16421 in Line 3490 is a way of checking for a full screen. The Spectrum does not need this line as it will offer a scroll when the screen is full. Therefore leave out Line 3490. However it appears again in Line 6342 where its purpose is different, so to get the same result change the 16421 to the Spectrum address 23689. (this can also be done in line 3490 if you wish) also the same appears in line 8515 and 8516.

The lines from 9360 to 9988 print the title screen. Replace all these with artwork of your own or, if you do not want to go to the trouble, simply omit them except for 9988 RETURN. Leave this last line in because at some points the program will jump to this routine and it is best to keep it in case you fail to find all the GO SUB 9960 statements. I would put some simple title in anyway, even if it is only to PRINT the name of the game.

Now for the hardest bit of all. lines 9952 to 9959 deal with movement of teams by poking information around the REMs. We have to find another way, so perhaps it is worth going back to standard principles, and writing the program in a more structured way. Add lines

```
9019 DIM O$(149,9): REM 1
counted 149 data items
9020 RESTORE: FOR i = 1 TO
149
9021 READ o$(i): NEXT i
```

Now all the Data is held in the elements of array o$( ) and so lines 22 to 28 can be further modified to

```
22 GO SUB 26
23 FOR c = 1 TO 9
24 PRINT o$(B + X,c); : PAUSE
25
25 NEXT c
26 LET X = VAL " 000022044
068092124125" : (((A-1) *
3 + 1) TO ((A 1) * 3 + 3))
27 RETURN
```

Apart from Line 22 which gosubs to 26 to get the position in o$( ) that the name now occupies and then returns to the same routine (recursive) the lines are straightforward.

Making the transfers also becomes simple, replace lines 9952 to 9959 with

```
9952 GO SUB 26: LET AA = X
9953 LET A = C: GO SUB 28
9954 LET o$(D + X) = o$
(B + AA)
9956 LET o$(B + AA) = v$
9957 RETURN
```

Now the reason we had the funny recursive positioning of line 26 becomes clear, we can use it from this routine to determine the X value. Once the two positions of the teams have been determined then they are swapped.

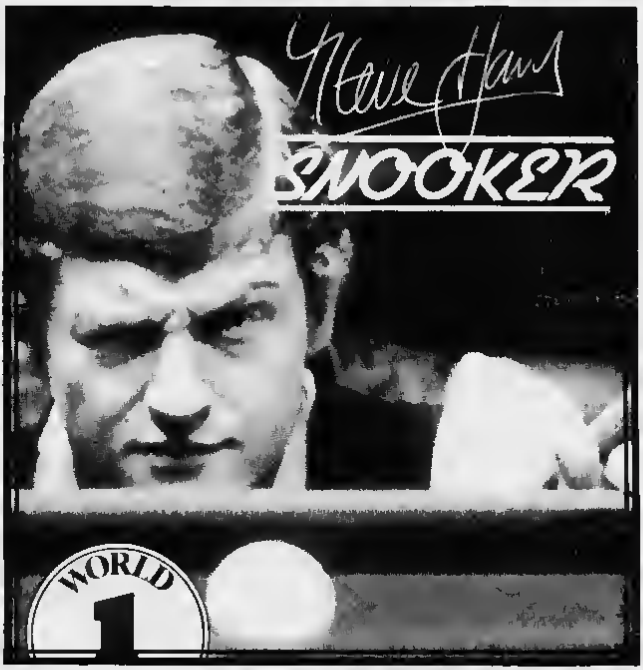
Finally I have written this as I developed the conversions deliberately in an attempt to demonstrate how a problem may be solved and then resolved as a conversion progresses. Structured programming is great, providing you have all the functions you require available. The ZX80 and 81 do not have data capabilities and the ways of emulating it are many and varied, this was a clever but fairly straightforward method.

Of course, there are other ways looking at it in retrospect I would probably use a three dimensional array DIM o$(32,7,9) and read each of the seven REM/DATA separately then the awkward Line 26 couldbe left out as the 'A' value becomes the second element — ie Line 24 would become PRINT o$(B,A,c) and lines 22 and 28 would be redundant. Many lines could also be compressed into multi-line statements and by using the DEF FN function several of the calculations could be speeded up and performed more efficiently.

I hope this has given you all some ideas, personally I find converting programs second only to creating an original for giving satisfaction, and as always if you have a problem drop me a line and I'll do my best to help.

Snooker Scoreboard

If you are a budding Steve Davis, this program from Dungannon's Brian Buckley will straighten your cue.



When playing Snooker the most tedious part is keeping track of the score. Not being an expert I also have difficulty in remembering the value of each colour! Frequently my family spend more time discussing the accuracy of the scores than actually playing so when this program arrived I found it very valuable indeed. Now here it is for you to share the benefits of an accurate and impartial referee.

Having typed the program in to the machine SAVE it with SAVE "SNOOKSCORE" LINE 30. This will ensure that the program automatically RUNs when subsequently LOADed from tape. All DATA should be checked for errors. After responding to all of the prompts at the start of the program there will be a short pause (about two seconds) as all the UDG's are set up. You will then see a snooker table being drawn on the screen followed by the scoreboard itself. This is the main display. I shall now describe the various features of the program.

Score correction

Pressing the "—" key (SYMBOL SHIFT and "J" pressed together) brings the score correction facility into operation. This allows corrections to be made to either player's score. When called, two short BEEPs will be heard and a prompt "Please ENTER ball to be deleted" will appear at the bass of the screen. The response to the prompt will be the incorrect ball. For example, if you accidentally add the blue ball to your score instead of a red. You would press "—" to use the correction routine and in response to the prompt ENTER "E". The prompt will then disappear and the value of the blue ball will be removed from your score. You will notice that "Last Shot" has changed to "error" to remind you that the corrected ball has ▶

Control keys

1 —	Changes FLASHing of one player s name to the other
0 —	When pressed at the end of a frame resets break and po nts to 0 and increases the ap propriate frame score by 1
R —	Adds value of Red ball to score of player whose name is FLASHing
Y —	Adds value of Yellow ball
G —	Adds value of Green ball
N —	Adds value of Brown ball
E —	Adds value of Blue ball
P —	Adds value of Pink ball
K —	Adds value of Black ball
F —	Brings Foul shot subroutine into operation
— —	Brings score correction subroutine nto opera tion

yet to be input You should remember that when correcting a score the points will be deducted from the player whose name s FLASHing and ENTER MUST be used This is to give the player us ng the facility time to think

Foul shots

If a foul shot is played the player responsible should have his name set to FLASH The 'F key should then be pressed After two short BEEPs a prompt Please ENTER the fouled ball will appear at the base of the screen The response to this will be the colour (only one letter!) of the ball which was fouled followed by ' ENTER If the cue ball was potted just press 'ENTER If for example you accidentally pot the black ball in stead of a red set your name to FLASH and then press F In response to the prompt ENTER ' K ' You w ll then see your op ponent s score increase by seven points and your Last shot change to foul When you are familiar with the ENTER ing system used in this part of the program you can just press ENTER when the value of the foul shot is four points (after call ing the routine of course) as it is when you miss a red or acciden tally pot a coloured ball whose value is worth up to and in cluding four points If a foul shot is played and the points for it g ven to the wrong player (pressing F when the inno cent player s name was FLASHing instead of the guilty player s name) just change the FLASH and carry out the score correction procedure removing the value of the foul and then the procedure for foul shots given above

Break

The program will display each player s break throughout the match but this will be correct is the following method is used

It is essential that the player at the table should have his name FLASH ng When his visit to the table s complete the FLASH should be changed to the other player The following ex ample will illustrate why

Dunng his visit to the table player 1 pots a red ball followed by the black His break is now eight points He returns to his seat after missing the next red (failing to pot it) with his break still eight points Player 2 comes to the table The scoreboard now shows his name FLASHing He attempts to pot a red ball but fails returning to his seat Player 1 then comes to the table again and the scoreboard changes so that his name FLASHes As the FLASH changes back to player 1 s name his previous break is reset to 0 If the FLASH had not been changed to player 2 when he was playing (even though he didn t score anything) it means that anything that player 1 scores this time will be added onto his previous break thus making the break incorrect

Points to note

In lines 1180 and 1200 the capital letters contained in double quotation marks should be typed In using GRAPHICS mode as they are user defined graphics characters A list of them appears below

"A"	▛
"B"	▜
"C"	▘
"D"	▝
"E"	▖
"F"	▗

in line 160 s$ contains seven spaces and following a b b1 and b2 with n the quotation marks there are two spaces After c and d there is only one space in quotation marks These numbers are the same throughout the listing

In line 180 the quotation marks after s$ contain two spaces

In line 380, the first set of quotation marks contain 20 spaces and the second 32

In line 540 32 spaces are contained in the quotation marks

Line 580 also has 32 spaces within quotation marks

In line 680 within the same quotation marks as "MATCH OVER four spaces are con tained before and after the words

In line 690 two spaces are inserted before and after the word in quotation marks

In line 700 the string after "MATCH INFORMATION con sists of 17 CHR$ 131 s

L ne 710 has 32 CHR$ 131 s in quotation marks

In 720 with n the quotation marks there are five spaces before and after the words

Line 1170 has 32 CHR$ 143 s within its quotation marks

In the first quotation marks in line 1180 there is one CHR$ 143 and A In the second set 14 CHR$ 143 s In set three 8 while in set four 13 CHR$ 143 s Finally in set five C and 1 CHR$ 143 are contained

In the long string n line 1190 there are 30 CHR$ 143 s Line 1200 is almost the same as line 1180 The dif ferences are in sets 1 3 and 5 where the graphics characters are D E and F Line 1210 has 32 CHR$ 143 s in quotation marks

Figure 2 Variables

a	Player 1 s score during a frame	af ( )	Stores player 1 s frame scores throughout the match
b	Player 2 s score during a frame	bf ( )	Scores player 2 s frame scored throughout the match
c	Player 1 s overall frame score	b1	Player 1 s break
d	Player 2 s overall frame score	b2	Player 2 s break
e	Value of blue ball	s1	X position of Player 1 s scores
f	Value of a Foul shot	s2	X position of Player 2 s scores
g	Value of Green ball	p1 p6	DATA for pockets for main display
k	Value of black ball	h	Highest break of match
l	Number of frames over which match s being played	hf	Frame in which highest break was obtained
n	Value of brown ball	a$	Player 1 s name
p	Value of Pink ball	b$	Player 2 s name
r	Value of Red ball	c$	Holds INKEY$
s	LEN a$	f$	INPUT for a foul shot
t	X position of Player 1 s name	h$	Holds name of player with highest break
u	LEN b$	m$	Holds name of winner of each frame
v	X pos tion of Player 2 s name	s$	Last shot
w	a minus b	v$	INPUT for score correction
x	b minus a	w$	" point or points ", depending on score dif ference
y	Value of Yellow ball	x$	" Frame " or " Frames " depending on l
z	Current frame	z$	" leads by "

Figure 3. Line description

LINE NUMBER	LINE FUNCTION
30	Sets screen colours and BEEPS upon LOADing from tape
40	Sets "L" cursor. PRINTs title and asks if instructions are required
60	Assigns pressed key to y$. If y$ is "y" control is sent to 860 for instructions to be PRINTed
70	Resets screen colours upon returning from instructions
80	READs values from the DATA statement in line 90 and sets these variables
100	Sets "C" cursor and activates keyboard BEEP. Requests Player 1's name to be ENTERed
110	Requests Player 2's name to be ENTERed
120	Requests the number of frames over which the match is to be played to be ENTERed and sets x$
130	PRINTs a thank you message, switches keyboard BEEP off, sets "L" cursor and sends control to subroutine at 1110 which PRINTs a snooker table on screen. Main screen is then PRINTed on the table
140	Reserves space for unscripted variables a and b. These are used to hold the scores at the end of each frame
150	Start of main loop
160	Sets various scores to 0 and then PRINTs these on screen
170	Sets Player 1's break to 0
180	FLASHes Player 1's name and PRINTs all of his scores
190	Checks c$ for "—" and if found brings score correction routines into operation
200	As in 190 but checks for "f" and deals with foul shots
210	Sets s$ to "" and sends control to 250 if c$ is "1"
220	If c$ is "0" (end of frame) and a > b sends control to 350
240	Updates Player 1's points score and break. Checks to see if the break > the highest break and if so, makes h$ = a$ and hi = the current frame (z). Also makes hi = b1
260	Sets Player 2's break to 0
270	FLASHes Player 2's name and PRINTs all of his scores
280	Checks of c$ is "—" and if so, sends control to score correction routines
290	Checks if c$ is "f" and if so, sends control to subroutine dealing with foul shots
300	If c$ is "1" sets a$ to "" and sends control to 170
310	Sends control to 350 if c$ is "0" and b > a
330	Updates Player 2's points score and break. Checks to see if the break > the highest break and if so, makes h$ = b$ and hi = z. Also makes hi = b2
350	If a > b, Player 1's frame score (c) is increased by 1 and a$ is assigned to m$
360	If b > a, Player 2's frame score (d) is increased by 1 and b$ is assigned to m$
370	Each Player's final score in a frame is assigned to the subscripted variables a and b. A check is made to see if a winner exists and if so, control is sent to 670
380	Plays a short tune at the end of a frame and blanks out the last shot for each player. Also blanks out the lead line
390	Increases current frame by 1. Sends control back to the start of the main loop
400 & 410	Check for keypresses
420	Assigns any pressed key to string variable c$
430	Crashproofing: checks for valid keys being pressed. If an invalid key is pressed a BEEP is issued and control sent back to the start of the subroutines at line 400
450 590	450 430 assign certain strings to s$ depending on c$. 540 580 update lead line and calculate the x position so as to keep it centralised on screen
600	Requests input for a foul shot and checks an try is valid. If not, then control is sent back to the start of the line
610	If f$ (input in above line) is one of five certain strings, then f$ is set to "4"
630	Deals with a foul shot against Player 2 by adding the relevant amount of his score and PRINTing it on screen
640	As 630 but for Player 1
650	Requests input for score correction and checks input for validity. If an invalid input is detected, control is sent back to the start of the line
670	BEEPs and flashes BORDER with various colours at the end of the match
680	Resets scores to 0 and PRINTs f nal screen
700	PRINTs information about highest break etc
710	PRINTS all frame scores for each player
720	Gives instructions for using program again
730	Assigns INKEY$ to z$. If z$ is "y" program is RUN again
740	Erases program from memory as it is no longer required. RANDOMIZE USR 0 was used as NEW did not remove UDG's
750 & 760	Scan keyboard for pressed keys
780	Calculates x position of Player 1's name and scores
790	Calculates x position of Player 2's name and scores
800 & 810	Prevent a and b1 becoming negative
830 & 840	Prevent b and b2 becoming negative
860 1030	Instructions
1040	PRINTs instructions about seeing instructions again
1060	Assigns INKEY$ to z$. If z$ is "y" then instructions are PRINTed again by sending control to line 860
1110 1160	Sets up UDG's for pockets
1170 1210	Draws table
1220 1260	DRAWs lines on table
1280 1330	DATA for UDG's

Bounce Down

Jack Knight goes beyond catching a bullet — catch a Brighton cannon ball!

The idea is crazy. Catch a *cannon ball* (but that's not all). What's the cannon ball doing? Would you believe, it's **bouncing!**

It takes a good eye to high score in this original arcade game written in BASIC. To play, use the cursor keys and to position the catcher to take the ball. But take care: a misjudgment can be fatal, and the bounce of the ball is not regular. If, instead of going through the opening, the ball comes down on the raised up top, the catcher is destroyed. You have a stock of seven catchers and 50 balls with which to set up a record score.

The main sections of the program are clearly identified by REMs which indicate their functions. But, the following comments may be of interest.

Variables d and a drive the cannon ball across the screen. The bounce is achieved by adding or subtracting dd (1 and using a double negative to make a positive).

The problem of identifying the blue opening of the catcher from the rest of the sky for the purpose of recording catches was overcome by printing a Y which is invisible because the INK colour is the same as the sky (and using SCREEN$). ATTRIBUTE is used to identify the catcher and also to ensure the cannon ball eraser does not erase part of the catcher.

To introduce variety, the track of the ball is not only random aided at the mouth of the cannon but is diverted (unevenness of the ground) en route.

Keyboard graphics have been used in particular to construct the cannon, not mainly because it's simpler but, as User Defined Graphics can be coarse, the result here would have been no improvement. The exception is the rim of the barrel where the keyboard graphics would have been too heavy. (You need to watch out for these two User Defined Graphics when typing the cannon construction program line). The cannon ball had to be specially designed (complete with shine) but has been made to earn its living by doubling, disguised in white, as the smoke from the cannon.

Variable i has been used as an on/off switch to ensure the ball is caught only when bouncing down and to restrict the destruction of the catcher to a direct hit on the raised up portion.

The design of the program means that New Game does not go through the opening instructions or the setting up again.

Alphanumerics

Darren-John Norbury of Andover sent us this 1 or 2 player game to make you think!

Alphanumerics is based upon the television quiz game Countdown. It is designed to test the player's (or players') quick thinking and agility with letters and numbers.

The game is divided into eight rounds, six of which are letters games, making the rest numbers games. In the letters games the computer will pick nine letters totally at random (following the verb or consonant prompt which is the only say in the player has in this choice of letters) and display them. The next then is to make the longest word possible inside the allocated thirty seconds (very rough timing) from the displayed letters. A scoring prompt occurs at the end of each game. The letters games are games 1, 2, 3, 5, 6 and 7.

Games 4 and 8 therefore are the numbers games. In this case the computer performs the choosing process itself and comes up with a display of 6 randomly picked numbers, five of which have come from the range 1 to 10 and the sixth of which will be either 25, 50, 75 or 100. Following this a target figure will be displayed. The idea of the game is using the four mathematical operations (addition, subtraction, multiplication and division) to manipulate the top numbers to arrive at the target figure (using each of the top numbers only once, if at all). Once again a scoring prompt appears at the end of the game.

Alphanumerics can be played by either 1 or 2 people. If you're playing alone then simply enter your score at the end of each round as prompted. Where two people play, however, the scorings is slightly different. In the letters game each of the players compare their respective scores. If there is a difference in scores then the higher scorer claims the points (the points being equal to the number of letters in the player's word) and the lower scorer receives zero. If the number of letters each has achieved is equal then both players get the points according to the value of the words made. In the numbers game each person always scores according to instruction laid down by the computer, regardless of who is nearer (unless, of course, they are more than 15 adrift).

The maximum points available in this game are 80, my personal best is 46 on the one player option. Good luck!

Letter Puzzle

A beautiful presentation of the block puzzle game from Joao Campos of Portugal.

A$ and B$	The two possible solutions
C$	Set of the 15 letters + space
D$	Auxiliary set to load L$ randomly
G$ and H$	The two solution impossible configurations
I and J	Loop control variables
K$	INKEY$ hold
L$	Letter disposition in the board
M	Original position of the moved letter
R	Random pointer to C$ and D$
RCD	Hi score
S	Moves counter
S$	Initial option (0 1 or 2)
V	Empty position in the board
X and Y	Printing coordinates (column and line)

This program is about 5 7K long

Figure 1 The main variables

I have used letters in this version rather than the more often used numbers the main reason being that each square is represented by only one character and this means it is easier to identify for moving

Once you have ENTERed and SAVEd the final version and you have RUN the program then after the title page has been displayed you have the option of choosing from two solutions of the puzzle You may choose solution number one or two or by pressing 0 take any of the two (lines 1000 1220) The computer then shuffles the letters (this is done in FAST mode – lines 600 990) and displays the initial disposition of the board (lines 2500-2540)

Now using the cursor keys you move the letters around (obviously you can only move each letter horizontally or vertically into the empty square) This is dealt with in lines 100 370 The moves you make are counted and a hi score (or rather a low score) is kept for finding the solution in the least possible moves

You will find that there are some initial settings that do not allow for a proper solution that s when the last three letters are M-O-N instead of M-N-O In this case either press the "F" key to restart game or wait for the computer to tell you that the solution is impossible (lines 5000 5010) and invite you to restart (lines 4140-4170)
