

(Chapter 12)
Electrolyte Solutions:
Milliequivalents, Millimoles, and
Milliosmoles

Lecture 2

Lecturer Anas Tarik Nafei

Millimoles and Micromoles

Electrolyte concentrations expressed in millimoles per liter (mmol/L) in representing the combining power of a chemical species.

A *mole* is the (molecular weight of a substance in grams). A *millimole* is one thousandth of a mole (molecular weight of a substance in milligrams) and a *micromole* is one millionth of a mole (molecular weight of a substance in micrograms).

$\text{Mole} = \text{wt. (g)} / \text{m.wt.}$

$\text{Millimole} = \text{wt. (mg)} / \text{m.wt.}$

$\text{Micromole} = \text{wt. (\mu g)} / \text{m.wt.}$

Important notes:

1- Millimolar conversions do not take into account the valence of an electrolyte as do milliequivalent conversions.

For monovalent species, the numeric values of the milliequivalent and millimole are identical.

2- Similar to milliequivalents, **the millimoles of the compound are equal to the millimoles of the cation, which are equal to the millimoles of the anion**, but this does not hold true for the actual weights of the ions.

Example calculations of Millimoles and Micromoles

1) How many millimoles of monobasic sodium phosphate monohydrate (m.wt. 138) are present in 100 g of the substance?

m.wt. = 138

100 g = 100000 mg

mmol = wt.(mg) / m.wt.

mmol = 100000 / 138 = 724.64 mmol \approx 725 mmol

or

According to the definition each 1 mole = 138 g

1 mole 138 g

X mole 100 g

X = 0.725 moles = 725 mmol

2) *What is the weight, in milligrams, of 5 mmol of potassium phosphate dibasic?*

$$\text{m.wt. of } \text{K}_2\text{HPO}_4 = [2 \times 39 (\text{K}^+) + 96 (\text{HPO}_4^{2-})] = 174$$

$$\text{mmol} = \text{wt. (mg)} / \text{m.wt.}$$

$$5 = \text{wt. (mg)} / 174$$

$$\text{wt. (mg)} = 870 \text{ mg}$$

3) Convert blood plasma levels range of 0.5 microgram/mL and 2 microgram /mL for tobramycin (m.w. = 467.52) to micromole /L?

Micromole = wt. (μg) / m.wt.

$$\text{Micromole} = 0.5 \mu\text{g} / 467.52 = 0.0010695$$

$$\begin{array}{rcl} 0.0010695 \text{ mcmol} & & 1 \text{ mL} \\ \times & & 1000 \text{ mL} \\ \hline & & = 1.07 \text{ mcmol} / \text{L} \end{array}$$

$$\text{Micromole} = 2\mu\text{g} / 467.52 = 0.0042778$$

$$\begin{array}{rcl} 0.0042778 \text{ mcmol} & & 1\text{mL} \\ \times \text{ mcmol} & & 1000\text{mL} \\ \hline & & = 4.28 \text{ mcmol} / \text{L} \end{array}$$

$$\text{Range} = 1.07 - 4.28 \text{ mcmol} / \text{L}$$

(4) *If lactated Ringer's injection contains 20 mg of calcium chloride dihydrate (CaCl₂ · 2H₂O) in each 100 mL, calculate the millimoles of calcium present in 1 L of lactated Ringer's injection.*

$$\text{m.wt. of CaCl}_2 \cdot 2\text{H}_2\text{O} = 40 (\text{Ca}^{2+}) + [2 \times 35.5 (\text{Cl}^-)] + [2 \times 18 (\text{H}_2\text{O})] = 147$$

$$1 \text{ L} = 1000 \text{ mL}$$

Millimole = wt. (mg) / m.wt.

$$\text{mmol} = 20 / 147 = 0.136$$

$$0.136 \text{ mmol} \quad 100 \text{ mL} \quad = 1.36 \text{ mmol / L of CaCl}_2 \cdot 2\text{H}_2\text{O}$$

$$\text{X mmol} \quad 1000 \text{ mL} \quad = 1.36 \text{ mmol / L of Ca}^{2+}$$

(5) *If lactated Ringer's injection contains 20 mg of calcium chloride dihydrate (CaCl₂ · 2H₂O) in each 100 mL. How many micromoles of calcium are present in each milliliter of lactated Ringer's injection?*

$$\text{m.wt. of CaCl}_2 \cdot 2\text{H}_2\text{O} = 40 (\text{Ca}^{2+}) + [2 \times 35.5 (\text{Cl}^-)] + [2 \times 18 (\text{H}_2\text{O})] = 147$$

$$\text{Microgram} = 20 \text{ mg} \times 1000 = 20000 \mu\text{g} / 100 \text{ mL}$$

Micromole = wt. (μg) / m.wt.

$$\text{mcmol} = 20000 / 147 = 136$$

$$\begin{array}{l} 136 \text{ mcmol} \\ \times \text{ mcmol} \end{array} \quad \begin{array}{l} 100 \text{ mL} \\ 1 \text{ mL} \end{array} \quad \begin{array}{l} = 1.36 \text{ mcmol} / \text{mL of CaCl}_2 \cdot 2\text{H}_2\text{O} \\ = 1.36 \text{ mcmol} / \text{mL of Ca}^{2+} \end{array}$$

(6) A patient is receiving a slow intravenous infusion containing 40 mEq of potassium chloride in 1000 mL of fluid. If, after 12 hours, 720 mL of infusion had been in used, how many millimoles of potassium chloride were administered?

M.wt. of KCl = 39 (K^+) + 35.5 (Cl^-) = 74.5 Valence = 1

mg = mEq x Atomic, formula, or molecular weight /Valence

mg = 40 x 74.5 / 1 = 2980 mg / 1000 mL of KCl received by patient

2980 mg	1000 mL	= 2145.6 mg of KCl after 12 hours
X mg	720 mL	

Millimole = wt. (mg) / m.wt.

mmol = 2145.6 / 74.5 = 28.8 mmol of KCl were administered

(7) A medication order calls for 1.8 g of potassium chloride in 60 mL of solution. How many millimoles of KCl are contained in each milliliter?

$$\text{M.wt. of KCl} = 39 (K^+) + 35.5 (Cl^-) = 74.5$$

$$\text{Mg} = 1.8 \text{ gm} \times 1000 = 1800 \text{ mg}$$

$$\begin{array}{rcl} 1800 \text{ mg} & 60 \text{ mL} & \\ X \text{ mg} & 1 \text{ mL} & = 30 \text{ mg of KCl} \end{array}$$

Millimole = wt. (mg) / m.wt.

$$\text{mmol} = 30 / 74.5 = 0.403 \text{ mmol / mL of KCl}$$

(8) Calculate the concentrations in mmol/L for each of the following infusion solutions: (a) 5% NaCl, (b) 3% NaCl, (c) 0.9% NaCl (NSS), (d) 0.45% NaCl (half -NSS), and (e) 0.2% NaCl.

M.wt. of NaCl = 23 (Na^+) + 35.5 (Cl^-) = 58.5

A) mg = 5 gm x 1000 = 5000 mg

5000 mg 100 mL = 50000 mg / L

X mg 1000 mL

Millimole = wt. (mg) / m.wt.

mmol = 50000 / 58.5 = 854.7 mmol / L

B) same as branch A: 30000 mg / L

mmol = 30000 / 58.5 = 512.82 mmol / L

D) same as branch A: 4500 mg / L

mmol = 4500 / 58.5 = 76.92 mmol / L

C) same as branch A: 9000 mg / L

mmol = 9000 / 58.5 = 153.85 mmol / L

E) same as branch A: 2000 mg / L

mmol = 2000 / 58.5 = 34.19 mmol / L

Osmolarity

Osmotic pressure is important to biologic processes that involve the diffusion of solutes or the transfer of fluids through semipermeable membranes.

Ex: solutions that provide intravenous (I.V.) replenishment of fluid, nutrients, or electrolytes, and the osmotic diuretic mannitol are required to state the osmolar concentration.

whether the solution is hypoosmotic, isoosmotic, or hyperosmotic with regard to biologic fluids and membranes.

Osmotic pressure is proportional to the *total number of particles (molecules or ions) in solution.*

The unit used to measure osmotic concentration is the *milliosmole* (mOsmol).

For **nonelectrolyte** (dextrose), 1 mmol (1 formula weight in milligrams) represents 1 mOsmol.

While **electrolytes** (the total number of particles in solution depends on the degree of dissociation of the substance in question).

Ex: Assuming complete dissociation, 1 mmol of NaCl represents 2 mOsmol ($\text{Na}^+ + \text{Cl}^-$) of total particles, 1 mmol of CaCl_2 represents 3 mOsmol ($\text{Ca}^{++} + 2\text{Cl}^-$) of total particles, and 1 mmol of sodium citrate ($\text{Na}_3\text{C}_6\text{H}_5\text{O}_7$) represents 4 mOsmol ($3\text{Na}^+ + \text{C}_6\text{H}_5\text{O}_7^-$) of total particles.

The milliosmolar value of *separate* ions of an electrolyte may be obtained by [dividing the concentration, in milligrams per liter, of the ion by its atomic weight].

The milliosmolar value of the *whole* electrolyte in solution is equal to the sum of the milliosmolar values of the separate ions.

Osmotic concentration = mOsmol

mOsmol = mmole (mole x 1000) x Number of species

mOsmol= {Weight (mg) / Molecular weight } x Number of species

Osmolarity = no. of mOsmol / L of solution

mOsmol/L = (concentration of substance [g/L] / Molecular weight [g]) x Number of species x 1000

A distinction also should be made between the terms *osmolarity* and *osmolality*:

osmolarity is the milliosmoles of solute per liter of solution

osmolality is the milliosmoles of solute per kilogram of solvent.

For dilute aqueous solutions, osmolarity and osmolality are nearly identical.

For more concentrated solutions, however, the two values may be quite dissimilar.

Osmometers are commercially available for use in the laboratory to measure osmolality.

Note: Abnormal blood osmolality that deviates from the normal range can occur in association with shock, trauma, burns, water intoxication (overload), electrolyte imbalance, hyperglycemia, or renal failure.

Example calculations of Milliosmoles

1) A solution contains 10% of anhydrous dextrose in water for injection. How many milliosmoles per liter are represented by this concentration?

Molecular weight of anhydrous dextrose = 180

Dextrose does not dissociate, therefore (no. of species)= 1

$$\begin{array}{l} 10 \text{ g} \quad 100 \text{ mL} \\ \text{X} \quad 1000 \text{ mL} \end{array} = 100 \text{ g/L}$$

$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$

$$\text{mOsmol/L} = (100 / 180) \times 1 \times 1000 = 555.56 \text{ mOsmol/L}$$

2) A solution contains 156 mg of K^+ ions per 100 mL. How many milliosmoles are represented in a liter of the solution?

Atomic weight of K^+ = 39

156 mg x 1000 = 0.156 g

$$\begin{array}{r} 0.156\text{g} \\ \times \\ \hline \end{array} \begin{array}{r} 100 \text{ ml} \\ 1000 \text{ ml} \\ \hline \end{array} = 1.56\text{g}$$

$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$

$$\text{mOsmol/L} = (1.56/39) \times 1 \times 1000 = 40$$

3) Calculate the number of milliosmoles corresponding to 0.386g of NaCl (m.wt. 58.5)?

$$\text{Wt} = 0.386 \text{ g} \times 1000 = 386 \text{ mg}$$

$$\text{No. of species} = 2 (\text{Na}^+ + \text{Cl}^-)$$

$$\text{mOsmol} = \{ \text{Weight (mg)} / \text{Molecular weight} \} \times \text{Number of species}$$

$$\text{mOsmol} = 386\text{mg} / 58.5 \times 2 = 13.2 \text{ mOsmol}$$

4) Calculate the osmolarity of 15 mOsm. Dissolved in enough water to make a total volume 100 ml?

Osmolarity = no. of mOsmol / L of solution

Osmolarity = 15 mOsmol / 0.1 L = 150 mOsmol / L

5) A pharmacist added 25ml of 7.5% solution of magnesium acetate (m.wt. 142) to a patient's infusion solution. How many mOsmol of magnesium acetate did the patient receive?

No. of species of magnesium acetate = $\text{Mg}^+ + 2 (\text{C}_2\text{H}_3\text{O}_2) = 3\text{parts}$

$$\begin{array}{rcl} 7.5 \text{ g} & 100 \text{ ml} & \\ \times & 25 \text{ ml} & = 1.875\text{g} = 1875 \text{ mg} \end{array}$$

mOsmol = { Weight (mg) / Molecular weight } x Number of species

$$\text{mOsmol} = 1875\text{mg} / 142 \times 3 = 39.6 \text{ mOsmol}$$

6) Calculate the osmolarity of a 3% hypertonic sodium chloride solution. Assume complete dissociation.

M.wt. of NaCl = 58.5

No. of species = 2 (Na⁺ + Cl⁻)

$$\begin{array}{l} 3 \text{ g} \quad 100 \text{ mL} \\ X \text{ g} \quad 1000 \text{ mL} \end{array} = 30 \text{ g/L}$$

Osmolarity = mOsmol/L = (Weight of substance (g/L) / Molecular weight g) x
Number of species x 1000

$$\text{mOsmol/L} = (30 / 58.5) \times 2 \times 1000 = 1025.64 \text{ mOsmol/L}$$

7) Calcium chloride dihydrate injection is a 10% solution of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$. How many milliosmoles are present in a 10-mL vial? Assume complete dissociation.

$$\text{M.wt. of } \text{CaCl}_2 \cdot 2\text{H}_2\text{O} = 40 (\text{Ca}^+) + [2 \times 35.5 (\text{Cl}^-)] + [2 \times 18 (\text{H}_2\text{O})] = 147$$

$$\text{No. of species} = 3 (\text{Ca}^+ \text{ and } 2 \text{Cl}^-)$$

$$\begin{array}{l} 10 \text{ g} \quad 100 \text{ ml} \\ \times \text{ g} \quad 1000 \text{ ml} \quad = 100 \text{ g/L} \end{array}$$

$$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$$

$$\text{mOsmol/L} = (100 / 147) \times 3 \times 1000 = 2040.81 \text{ mOsmol/L}$$

$$\begin{array}{l} 2040.81 \text{ mOsmol} \quad 1000 \text{ mL} \\ \times \text{ mOsmol} \quad 10 \text{ mL} \quad = 20.408 \text{ mOsmol in 10 mL vial} \end{array}$$

8) If a pharmacist wished to prepare 100 mL of a solution containing 50 mOsmol of calcium chloride, how many grams of calcium chloride would be needed? Assume complete dissociation.

$$\text{M.wt. of CaCl}_2 = 40 (\text{Ca}^+) + [2 \times 35.5 (\text{Cl}^-)] = 111$$

$$\text{No. of species} = 3 (\text{Ca}^+ \text{ and } 2 \text{Cl}^-)$$

$$\begin{array}{rcl} 50 \text{ mOsmol} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & = 500 \text{ mOsmol / L} \end{array}$$

$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$

$$500 = \left[\frac{\text{weight of substance (g/L)}}{111} \right] \times 3 \times 1000$$

$$\text{Weight of substance} = (500 \times 111) / 3000 = 18.5 \text{ g/L}$$

$$\begin{array}{rcl} 18.5 \text{ g} & 1000 \text{ mL} & \\ \times & 100 \text{ mL} & = 1.85 \text{ g of CaCl}_2 \end{array}$$

9) What is the osmolarity of a solution containing 5% dextrose and 0.45% sodium chloride (D5 $\frac{1}{2}$ NS)? Assume complete dissociation.

Molecular weight of dextrose = 180

Dextrose does not dissociate, therefore (no. of species)= 1

$$\begin{array}{rcl} 5 \text{ g} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & = 50 \text{ g/L} \end{array}$$

mOsmol/L = (Weight of substance (g/L) / Molecular weight g) x Number of species x 1000

$$\text{mOsmol/L} = (50 / 180) \times 1 \times 1000 = 277.78 \text{ mOsmol/L}$$

M.wt. of NaCl = 58.5

No. of species = 2 (Na⁺ + Cl⁻)

$$\begin{array}{rcl} 0.45 \text{ g} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & = 4.5 \text{ g/L} \end{array}$$

mOsmol/L = (Weight of substance (g/L) / Molecular weight g) x Number of species x 1000

$$\text{mOsmol/L} = (4.5 / 58.5) \times 2 \times 1000 = 153.85 \text{ mOsmol/L}$$

$$\text{Total} = 277.78 + 153.85 = 431.62 \text{ mOsmol/L}$$

10) PLASMA-LYTE 56 contains 32 mg of magnesium acetate tetrahydrate, 128 mg of potassium acetate, and 234 mg of sodium chloride in each 100 mL of solution. What is the osmolarity of this solution? Assume complete dissociation.

$$\text{M. wt. of Mg(C}_2\text{H}_3\text{O}_2)_2 = 24 (\text{Mg}^+) + [2 \times 59 (\text{C}_2\text{H}_3\text{O}_2^-)] + [4 \times 18 (\text{H}_2\text{O})] = 214$$

$$\text{No. of species} = 3(\text{Mg}^{2+} + 2 \text{C}_2\text{H}_3\text{O}_2^-)$$

$$\begin{array}{rcl} 32 \text{ mg} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & \\ & & = 320 \text{ mg/L} = 0.32 \text{ g/L} \end{array}$$

$$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$$

$$\text{mosmol/L} = 0.32 / 214 \times 3 \times 1000 = 4.49 \text{ mOsmol/L}$$

$$\text{M. wt. of potassium acetate (KC}_2\text{H}_3\text{O}_2) = 39 (\text{K}^+) + [59 (\text{C}_2\text{H}_3\text{O}_2^-)] = 98$$

$$\text{No. of species} = 2(\text{K}^+ + \text{C}_2\text{H}_3\text{O}_2^-)$$

$$\begin{array}{rcl} 128 \text{ mg} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & \\ & & = 1280 \text{ mg/L} = 1.28 \text{ g/L} \end{array}$$

$$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight g}) \times \text{Number of species} \times 1000$$

$$\text{mosmol/L} = 1.28 / 98 \times 2 \times 1000 = 26.12 \text{ mOsmol/L}$$

M.wt. of NaCl = 58.5

No. of species = 2 (Na⁺ + Cl⁻)

$$\begin{array}{rcl} 234 \text{ mg} & 100 \text{ mL} & \\ \times & 1000 \text{ mL} & = 2340 \text{ mg/L} = 2.34 \text{ g/L} \end{array}$$

mOsmol/L = (Weight of substance (g/L) / Molecular weight g) x Number of species x 1000

$$\text{mOsmol/L} = (2.34 / 58.5) \times 2 \times 1000 = 80 \text{ mOsmol/L}$$

$$\text{Total} = 4.49 + 26.12 + 80 = 110.61 \text{ mOsmol/L}$$

11) Calculate the milliequivalents of sodium, potassium, and chloride, the millimoles of anhydrous dextrose, and the osmolarity of the following parenteral fluid. Assume complete dissociation.

Dextrose, anhydrous	50 g
Sodium chloride	4.5 g
Potassium chloride	1.49 g
Water for injection, ad	1000 mL

Sodium Chloride

$$\text{mEq} = 4500 \times 1 / 58.5 = 76.92 \text{ mEq NaCl} = 76.92 \text{ mEq of } Na^+ \text{ and } 76.92 \text{ mEq of } Cl^-$$

$$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight (g)}) \times \text{Number of species} \times 1000$$

$$\text{mOsmol/L} = (4.5 / 58.5) \times 2 \times 1000 = 153.85 \text{ mOsmol/L}$$

Potassium Chloride

$$\text{mEq} = 1490 \times 1 / 74.5 = 20 \text{ mEq KCl} = 20 \text{ mEq of } K^+ \text{ and } 20 \text{ mEq of } Cl^-$$

$$\text{mOsmol/L} = (\text{Weight of substance (g/L)} / \text{Molecular weight (g)}) \times \text{Number of species} \times 1000$$

$$\text{mOsmol/L} = (1.49 / 74.5) \times 2 \times 1000 = 40 \text{ mOsmol/L}$$

Dextrose:

Millimole = $50000 / 180 = 277.78$ mmol

mOsmol/L = (Weight of substance (g/L) / Molecular weight g) x Number of species x 1000

mOsmol/L = $(50 / 180) \times 1 \times 1000 = 277.8$ mOsmol/L

76.92 mEq of Na^+ ; 20 mEq of K^+ ; 76.92 mEq of Cl^- and 20 mEq of $Cl^- = 96.92$ mEq of Cl^-

Osmolarity = 153.85 mOsmol/L + 40 mOsmol/L + 277.8 mOsmol/L = 471.62 mOsmol/L

**Thank
you!**
