

Wild Child Poll Quantitative Survey

August 2010

Prepared for:

Heritage Council of
Ireland

Prepared by Martha Fanning

J.2030

Introduction

RESEARCH OBJECTIVES

Market research was required to understand the types of activities adults did as children, and the extent to which their children do these nowadays

RESEARCH APPROACH

An agreed questionnaire was included in Behaviour & Attitude July TeleBarometer. TeleBarometer is a nationally representative survey of adults 16+, with quota controls on gender, age, social class, region and area.

TIMING

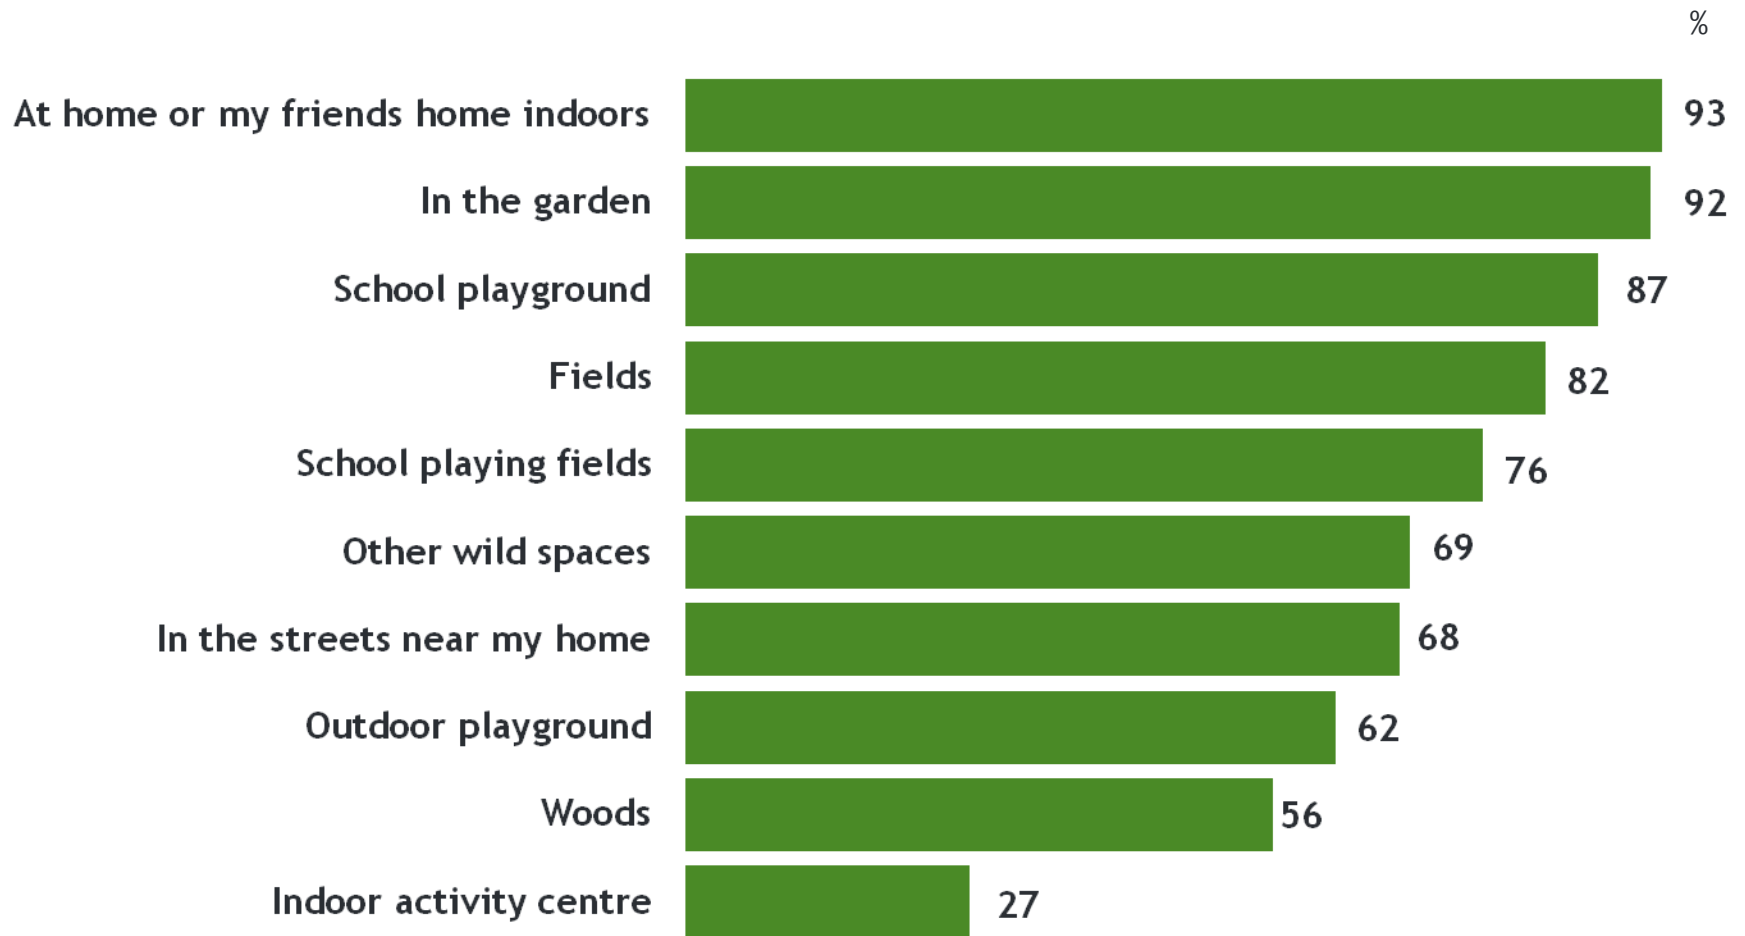

Fieldwork took place 20th July - 3rd August 2010

Play & Supervision

Frequency of Engaging in Such Activities with Children

All adults with children: 598

Benefits of Outdoor Activities

Attitudes to Spending Time Outdoors

All adults aged 16+: 1,000

Key Findings

Key Findings

Areas Played in as a Child

- At home, in the garden and the school playground are by far the most commonly mentioned places to play.
- Fields generally and more specifically, school playing fields are also quite common.
- At a lower level, wild spaces, streets near home, outdoor playground and woods are mentioned, with levels all still over 50%.
- Indoor activity centre is at much lower levels.
- Looking at the demographics behind these figures, boys appear to have played a little further away from home, as did the over 55s.
- Obvious differences emerge by region and area, with Dubliners and urban dwellers least likely to play in fields, woods, or other wild spaces, and a little more likely to have played in indoor activity centres.

Key Findings

Level of Supervision Playing as a Child

- School and at home, indoors are the most supervised areas, with over half supervised in these areas. Just under half felt they were supervised in the garden, with roughly a third supervised in an outdoor playground.
- Less than a quarter felt they were supervised in indoor activity centres, on the streets, in fields, woods or other wild places.
- Men and over 35s, much less likely to have been supervised.

Key Findings

Areas Own Children Play/Played in Aged 7-11

- Own children play or played primarily at home or in the garden and at school, with school playing fields, and outdoor playground forming a second division.
- Indoor activity centres, fields and streets are above the 50% level, with other wild spaces just below this and woods at just over a third.
- The key differences included reductions in children playing in fields 82% → 59%, other wild spaces 69% → 49%, and woods 56% → 37%, and an increase in people playing in school playground 87% → 92%, school playing fields 76% → 83%, outdoor playground 62% → 80% and indoor activity centre 27% → 68%.
- There is less gender bias evident than with the adults, although the regional skew remains.

Key Findings

Level of Supervision of Own Children's Play

- Home and school are again the key areas, as are indoor and outdoor play areas - all of these are above 66%.
- Streets and fields are next at below half, with wild space at a third and woods at one quarter.

Key Findings

Access to & Appreciation of Nature/Wild Areas

- 83% of adults or over 4 in 5 felt they had access to nature/wild areas as a child, with 78% or just under 4 in 5 suggesting that their kids have access to these spaces.
- Adults on average believe they can identify 7.8 of the 9 species, but reckon their children can only identify 6.6.
- Amongst adults, under 35s drops to 7.0 and in Dublin it comes in at 7.4.

Key Findings

Outdoor Activities Enjoyed as a Child

- Widespread enjoyment of most of the activities under review; only gardening, swimming in a lake/river and looking for insects fall below the enjoyment threshold.
- However, when we look at activities they involve their children in nowadays, while feeding the birds has a significant lead, gardening and looking for insects are second and third.
- 50% have never swum in a lake or river with their kids, 40% have never climbed trees and one in three have never made a daisy chain or built a camp/den.

Appreciation of the outdoors

- There is widespread agreement with the positive physical and mental health benefits. Over 9 in 10 agree strongly with these statements. Agreeing strongly drops to 85% in relation to sleeping better following time spent outdoors and drops again to 71% in relation to outdoor activities being an important part of a child's development.
