Re: ADA Accessibility Survey and Assessment – Weniger Hall

Dear Gabriel,

We are pleased to submit this report for Weniger Hall. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

A handwritten signature in black ink, appearing to read "Syroun Z. Sanossian".

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on December 13, 2016. The exterior site elements were assessed originally as part of the pedestrian facilities assessment, in June to September 2011, and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

Weniger Hall is a pre-ADA building and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. Narrative Analysis: The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified, but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

NOTE: Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. Barrier Data Records: Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.

In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.

A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve Weniger Hall. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing on one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians, but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building that was constructed prior to the passage of the ADA, Weniger Hall should have at least one accessible entrance. The main entrance located on SW Memorial Place and an additional accessible entrance is located on the south end of the building serving the auditorium located in the area. The main entrance was identified with an accessible route that leads to the first floor main entrance and a corridor where an elevator is used to carry passengers to reach all floors.

Weniger Hall has an accessible route within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public

transportation stops to the accessible building or facility entrance they serve¹ as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities (as a separate report) as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located along Monroe Avenue. Parking is provided east of the building and a bus stop is provided directly north of the building. No ISA directional sign is provided around the building to avoid a person having to retrace their steps.

Six entrances to the building are provided with three accessible entrances. The North West and southwest entrance lead to the first floor while the south entrance lead to the basement. These entrances are provided with automatic door opening devices. At the south entrance, an accessible ramp leads to the basement. The top of the ramp lacks a accessible guardrail with a drop greater than 30". The southwest entrance is a freight entrance and contains a freight elevator.

The non-accessible entrances are located on the northwest and southwest side of the building. Although, these doors are do not need to be accessible, the stairs lack contrasting colors and handrails.

Weniger Hall provides administrative service centers including the following:

- Physics Department
- Ethnobiology and Environmental Anthropology
- Department of Statistics
- Integrative Biology
- NPIC (National Pesticide Information Center)
- College of Oceanic and Atmospheric Sciences
- Department of Environmental and Molecular Toxicology
- Department of Fisheries and Wildlife Annex
- Linus Pauling Institute

INTERIOR SPACES

BASEMENT

Weniger Hall is a seven-story building including a basement and a greenhouse roof. The building provides classrooms, biology labs, physic labs, statistic labs, graduate student offices, conference rooms, and administrative services or department offices. An accessible entrance to the basement is located on this level south of the building. The basement

¹ 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points

houses three classrooms and multiple utility rooms. These classrooms also have entrances on the first floor. The elevator in this building does not have a stop on this level. The only interior pedestrian connection between the basement and first floor is through a storage corridor with a sloped floor, which is not meant for public use. Visitors would otherwise need to exit the building, travel up the ramp on the south side of the building and around the building to reach the main entrance to reach other areas within the structure.

Classroom entrances on the basement level were accessible as they were equipped with automatic door opening devices, although the door mechanisms were not adjusted to re-open after meeting an obstruction. The doors also were not identified with ISA signage. Classrooms on this floor lacked accessible emergency phones and tactile exit signs, and visual signal appliances (strobes) were not identified in the spaces. Accessible desks did not meet the needed ratio and lacked accessible knee clearance. Stairs did not have contrasting color and handrails on both sides.

Many *staff use only* areas were identified in the building. These spaces include IT rooms, janitorial rooms, private faculty offices and associated spaces. Signage at the door/doorway to these spaces is included in this report when it is located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff-use-only areas accessible as needed through the reasonable accommodation iterative process between the employer and employee.

FIRST FLOOR

One accessible entrance with two entry doors is provided on the first floor along SW Memorial Place. The doors on the south side of the entry lobby are equipped with an automatic door opening device, but the non-accessible doors on the north side of the main entry lacked ISA directional signage indicating the location of and route to the accessible entry doors that are not visible from an approach from the north. The entrance lobby lacks lobby informational signage indicating where accessible features such as restrooms or the elevator are located.

The first floor entrance to the classroom located on the south side of the building was identified with tactile signage posted on the corridor wall more than 20 feet from the actual entrance door. This sign can remain but an additional tactile sign should be provided within 18 inches of the entrance door (see photo at left).

The building has exit stairways located at each of the four corners of the building that appeared to be in original condition. Doors leading to the exit stairways were lacking tactile exit signage. Handrails, stairway treads and risers were non-accessible and each stairway has an intermediate fire escape door that lacked accessible door hardware, a door closer operating force/sweep period, clear width, and the view panels were not accessible to short people.

The fire escape doors lead to an exterior landing which may have been planned as a rescue area where fire risers protruded and the guardrail are not accessible height with openings larger than 4 inches wide (see photo at below).

A passenger elevator and a freight elevator exist in the building but do not travel to the basement level where three classrooms are provided. The northwest passenger elevator was not identified with signage indicating that the first floor was the discharge level for passengers traveling in that elevator. The hall call and car control buttons do not fully illuminate and the emergency buttons are not grouped together. Handrails in the elevator are not accessible. The southeast freight elevator lacked hall call buttons and hall lanterns. The car control buttons do not illuminate. The door leading outside does not open automatically and needed non-accessible force to operate.

Barriers identified along the first floor were commonly identified throughout the building in common use areas. Classrooms and the laboratory space on this floor lacked entry doors that operated with accessible opening force and lacked accessible door view panels. In addition, accessible emergency phones, first aid kits, tactile exit signs, and visual signal appliances (strobes) were not identified in those spaces. The workspaces within the laboratories lacked accessible desks, work counters, fume hoods, sinks, emergency

eyewashes and showers, as well as controls such as electrical switches and outlets that were not located within accessible reach ranges. Classroom 116 was identified with 116 desks and all desks that were accessible were located at the back of the classroom, with no accessible desks integrated into the overall group of desks.

Past that, students who used the accessible desks were not able to travel to the lower level of the classroom to participate in activities, such as making presentations or meeting with professors to discuss instructional information as the only path of travel to that area is by way of stairs. A wheelchair lift should be installed at the stairway along with accessible signage to indicate to students that this option is available to make it possible for them to participate equally with in instruction.

Offices for graduate students lacked accessible signage, door hardware, and a door closer operating force/sweep period where door closers were installed. The entry door also had view panels that were not accessible to short people or wheelchair users and lacked visual signal appliances (strobes) connected to the fire alarm system. In many instances, the entry doors lacked accessible maneuvering clearance as either a result of the original design or due to the location of furniture or other items that encroached into the space needed by wheelchair users to maneuver. The lack of accessible maneuvering clearance may necessitate the installation of automatic door opening devices at entrance doors to classrooms and labs in many locations.

Accessible men and women’s restrooms were located on each floor. The entry doors were automatic but the devices installed were not adjusted to reopen after encountering an obstruction. The floor slopes in the restrooms were over 2% in multiple locations. The lavatories were identified as lacking accessible knee clearance in lavatory, grab bar

locations, and water closet locations. Restrooms from floor 1 through 5 are nearly identical in barriers.

Faculty office spaces and conference rooms, used for student meetings, lacked accessible entry door hardware, operating force where closers are installed, accessible signage, view panels usable by short people and the spaces lacked maneuvering clearance within the space to allow wheelchair users to participate in meetings. Conference rooms and auditoriums in the building also lacked assistive listening systems. The clear floor space needed to enable use of whiteboards and the chalkboards was blocked by furniture or were stored items in some locations. The spaces generally lacked accessible light switches and outlets, accessible desks, computer workstations, coat racks and strobe devices. Where sinks were provided, access for wheelchair users and short people was not available.

The corridor was identified with a ramp with a running slope over 8%, which led to the storage room that connected to the basement. As stated above, the storage corridor is not public. The walkway next to the ramp also lacked accessible clear width. Three drinking fountains were provided within the corridors, but none of them were located in alcoves or are otherwise provided with protection for people with vision impairments who cannot see the protruding fountains before they make body contact. One of the three fountains was identified as accessible for people using wheelchairs and the other two were taller and accessible for people with bending and stooping injuries. Fire alarms and fire extinguishers were not fist operable and were often located outside of accessible reach range.

SECOND, THIRD, FOURTH, FITFTH, AND SIXTH FLOORS

Barriers noted above in public use spaces were similar to those identified in the upper floors of the building. Restrooms were identified with virtually identical barriers to access and laboratory spaces on the upper levels were not accessible, including workstations, desks, sinks, fume hoods or instructional areas where students gave presentations. Faculty office spaces and conference rooms used for student meetings lacked accessible entry

door hardware, operating force where closers were installed, accessible signage, view panels usable by short people and the spaces lacked maneuvering clearance within the space to allow wheelchair users to participate in meetings.

The Physics Studio Lab 212 was identified with a total of 8 large group tables with a total of 72 seats for students. The pedestal-based tables lacked accessible knee clearance which could prevent a person using a wheelchair from sitting with a group

during instruction, but replacing one of the group tables would not achieve dispersed accessible seating. Caution should be taken when determining how many group tables should be replaced to ensure that people with disabilities do not become segregated.

Conference rooms and auditoriums on the upper floors lacked accessible tables and assistive listening systems. Two drinking fountains were provided within the corridors on each floor, but the fountains were not located in an alcove or otherwise provided with protection for people with vision impairments who cannot see the protruding fountains before they make body contact. The third through seventh floors were identified with both a

low and high fountain located in different parts of the central corridor. Some of the upper floors had one low fountain that was located adjacent to the passenger elevator with no wing wall or other type of detectable warning (see photo at left). The low fountains on floors two, four and six were also not installed with accessible knee clearance. Floor two has no high fountain. Toilet rooms on the upper floors appeared to have been altered to improve access where automatic door opening devices were

installed. Although these restrooms generally provide wheelchair accessible toilet stalls, the lavatories, mirrors and dispensers were not identified as accessible.

The fourth floor had a physics department dark room. The entry corridor did not meet accessible width and turning space, although wheelchair accessible darkroom doors were available. The room lacked clear floor space at multiple locations such as corridor locations where a change of direction occurs, between stored carts or equipment and counters. The maneuvering space between the counters was not at least 60" wide for people using wheelchairs to turn 360 degrees, counters were not identified with an accessible section, the sink in the lab was not accessible and controls on essential equipment such as the developer were not accessible for short people or people who use wheelchairs.

The central corridor on the fifth floor was identified with double doors that were each too narrow to allow the passage of a person using a wheelchair. There are at least two options when remediating this barrier: the installation of an automatic door opening device that can open both doors simultaneously, or install two new doors where one door leaf provides at least 32" clear width. The only sanitary facility in the building was located on the sixth floor and included a non-accessible restroom unisex toilet room and shower that appeared to be in original condition.

The sixth floor mainly had greenhouses. A narrow corridor led to the restroom. Due to the lack of space in the corridor, maneuvering clearance is an issue at other spaces. The restroom was 54" x 48" and lacked maneuvering clearance. The shower entry was identified with a high curb and lacked accessible maneuvering clearance, a transfer seat or controls and an adjustable showerhead. In addition to common barriers described above for previous corridors, the sixth floor corridor

was identified with non-accessible slopes exceeding 2% at door landings, changes of direction and landings at controls and mechanisms (see photo at left).

The greenhouses lacked accessible passage space, turning space, workstations, lavatory, and reach ranges. Mats may become a tripping obstacle. In some of the greenhouse spaces, minimum clear width was lacking and equipment will need adjustment to provide an accessible route. Entrance doors, sinks, workstations and work counters were also not identified as accessible in the greenhouses shown at right.

The following barrier data records provide more detailed information on the barriers described above.
